For my son —
may you remember.

“The privilege of a lifetime is being who you truly are.”

— Joseph Campbell

Prologue

This book is a synthesis of years of thinking about one central question: *what is reality, really?*

It moves between philosophy, the occult, and alternative history to challenge the way we understand existence, perception, and the past. Instead of treating these as separate subjects, it connects them into a single unfolding inquiry into whether our current picture of reality is complete—or only a surface layer.

You've felt it too, haven't you? You grew up in a world where they tell you that when you die, that's it — you will lie in your grave forever. I mean, what does it take for this not to be true? Invent some form of technology to make you immortal? Then you live for thousands of years, and then what? You are still dead. You have just prolonged the inevitable. And what about all the others? Shall you make them immortal too? No kind of technology can make you truly immortal. You know that. But still, you try because you don't want to die.

There was a Big Bang. We evolved from apes. We were born from matter, and we will return to matter and, quite frankly, we don't matter because we are just that: matter.

I mean, what is the way out here? Your religious beliefs? It's comforting, but deep down you know it: there's no such thing as the supernatural.

So, there is no meaning to life. Why go on? You go on because we are survival machines. Kind of absurd when you think about it!

So, what is the grand conclusion here? If you ask an honest philosopher, what would he say? Commit suicide? Or just embrace the absurd and celebrate your own eternal death while you still have the chance?

Albert Camus would probably say: yes, life is absurd, but Sisyphus keeps pushing the stone.

Friedrich Nietzsche would say that meaning is not discovered but created. If God is dead, then humanity must become the creator! He would likely see "nothing matters" as weakness and urge transformation instead. Become Superman!

Arthur Schopenhauer was far darker, they say. And Søren Kierkegaard would say that reason alone cannot save you. For him,

the answer was a leap into faith!! Then Jean-Paul Sartre would argue that humans are “condemned to be free.” There is no built-in meaning, so you bear the terrifying responsibility of creating one yourself. Jean-Paul Sartre famously said that “existence precedes essence.” For example: a spoon has a purpose (to scoop food) because someone made it with a purpose in mind. Its meaning comes before it exists. But humans are different — at least if there is no God. If there is no creator, then there is no predefined human purpose. Humans simply exist first and only later create meaning through their choices and actions.

Ludwig Wittgenstein might challenge the structure of the question itself. He often suggested that the deepest problems of life cannot be solved like scientific problems because they lie at the edge of language. “All is a language game,” he said while using language! If all thought is trapped in language games, then Wittgenstein’s own theory also seems trapped inside one.

But how can Wittgenstein say all is a language game? Can language step outside itself and know itself in that way? Can language step outside itself in order to describe itself objectively? If everything is relative, isn’t that also relative? Don’t you just hate philosophy? “Whereof one cannot speak, thereof one must be silent.” Or some such nonsense!

- Is “everything is a language game” itself just another language game?

- If yes, why privilege it?

- If no, then he escaped the trap he says nobody can escape.

(Did he climb the ladder that does not exist, only to tear it free beneath him and use it to climb even higher?)

But one man did escape:

Philipp Mainländer is probably the clearest historical example. He believed existence itself was a mistake and that the universe was moving toward self-annihilation. He completed his major work, *The Philosophy of Redemption*, and then killed himself shortly after it was published. His philosophy treated nonexistence as preferable to existence.

So his basic idea is that God is alone, got sick of being alone, and the Big Bang is God killing himself like a bullet to the brain, and we are the aftermath — the dying corpse of God.

His basic idea was roughly:

- Originally, there was a perfect unified God/Absolute.
- But unity itself was unbearable or unstable.
- God desired nonexistence.
- Since a perfect unity could not directly cease to exist, it shattered itself into the universe.
- The cosmos is therefore the ongoing decomposition of God.
- Time, entropy, death, and cosmic decay are the slow process of divine self-annihilation.

So for Mainländer, the universe is not the creation of a living God but the corpse of a dead one.

The closest modern scientific parallel would be entropy and the “heat death” of the universe: everything slowly winding down toward nothingness.

My own personal opinion on all of this is: they are all wrong! That is it! The Big Bang is wrong. Evolution is wrong. Camus, Nietzsche, Schopenhauer, and even Kierkegaard are wrong. Philipp Mainländer is tragically wrong. Modern science is wrong. The world you grew up in is wrong. Even religion is wrong. We live in the upside-down world.

But if all this is wrong, what does the real world look like — the world that has been hidden from view? In this book, we explore the grand narrative!

But my big point with all of this is this: the real world turns out to be crazier than sci-fi because, in some sense, it must be. How else do you get a meaningless world if the real world is magical and full of meaning?

In other words: if reality is fundamentally meaningful, alive, or “magical,” then a meaningless modern worldview does not emerge naturally. It must be constructed — filtered, inverted, reduced. The philosophers you have just read about built their systems upon this filtered version of reality, which is why I believe they arrived at the wrong conclusions. I am not claiming to be smarter than they were. I am claiming that the filter itself has been mistaken for reality.

And therein lies the great irony: humanity has been taught to view the “magical” worldview as fantasy, while accepting the paradoxical worldview of modern materialism as reality. Yet perhaps the truly astonishing thing is not that ancient people saw meaning everywhere, but that modern humanity came to experience existence as dead, mechanical, and meaningless in the first place.

That is why I say the real world is stranger than science fiction. Not because it is irrational — on the contrary, I believe it is deeply logical — but because genuine logic ultimately points toward what modern culture dismisses as fantasy. The existence of our disenchanted worldview all but guarantees it.

A crack appears.

At first it is small. A strange coincidence. But some of us kept staring into the fracture until the fracture began staring back.

This book emerged from that fracture.

We live in an age overflowing with information yet starving for meaning. Beneath the surface, there exists a growing sense that something essential has been forgotten. We feel it in the collapse of trust, in the fragmentation of culture, in the loneliness of modern life, and in

the strange intuition that our civilization may understand everything except itself.

Modern society often treats mystery as a temporary inconvenience. Given enough time, enough funding, enough computation, all riddles will supposedly dissolve into mechanisms. Yet the deeper one investigates existence, the stranger it becomes. Consciousness remains unexplained. Time remains mysterious. Matter dissolves into abstraction. Reality itself appears increasingly dreamlike beneath the microscope of modern physics.

Every age possesses a governing story.

And perhaps ours is finally beginning to collapse. This is the moment we have been waiting for.

So free your mind.

Introduction

This book was not written to provide comfort.

It was written because too many pieces refused to remain separate.

For years I encountered strange parallels appearing across entirely different domains of thought. Physics echoed ancient symbolism. Myths mirrored cosmology. Philosophy converged with geometry. Conspiracy theories, often dismissed as madness, occasionally concealed deeper psychological truths about power, perception, and control. Spiritual traditions separated by oceans and centuries seemed to point toward similar structures beneath reality itself.

At first these connections appeared accidental. But over time the pattern became increasingly difficult to ignore.

Modern civilization prides itself on specialization. Knowledge has been divided into isolated territories: physics, religion, psychology, archaeology, metaphysics, engineering, mythology, history. Experts are trained to remain within their designated walls. Yet reality itself may not respect those walls.

This book attempts to cross them.

Not recklessly, but deliberately.

The pages ahead are not meant to be interpreted as a rigid doctrine. They are an exploration—a grand narrative attempting to reconnect fragmented domains into a single vision of existence.

Some readers will view this work as philosophy. Others will interpret it as speculative metaphysics, symbolic analysis, conspiracy research, spiritual inquiry, or alternative history. In truth, it is all of these at once.

The central intuition guiding this book is simple:

Humanity may have forgotten something fundamental about reality.

Not merely technological knowledge, but a deeper orientation toward existence itself.

The modern worldview often presents the universe as accidental, mechanical, fragmented, and ultimately meaningless. Consciousness becomes a byproduct. Life becomes an anomaly. Meaning becomes subjective. Yet many ancient traditions described reality very differently: as living, interconnected, symbolic, recursive, and deeply participatory.

This tension between the modern and ancient worlds lies at the heart of the book.

This Work

This work explores a wide range of unconventional ideas and possibilities, including subjects many would consider bizarre or impossible — Bigfoot, ancient mysteries, hidden civilizations, and other fringe phenomena among them. Yet the truth or falsity of any single claim is not what ultimately determines the validity of the worldview presented here.

To use an analogy from *The Matrix*: within the film, vampires and werewolves were said to exist because they belonged to earlier versions of the Matrix. If later versions no longer contained them, this would not invalidate the existence of the Matrix itself. In the same way, my worldview is fundamentally rooted in idealism — the idea that reality is consciousness-based. Such a framework allows for the possibility of extraordinary phenomena, but it does not depend upon any single one being true.

Some mysteries may eventually prove real. Others may dissolve. Either outcome leaves the core structure intact.

So you cannot say, “Oh, Bigfoot turned out to be fiction, therefore your entire worldview is false.”

A worldview should be judged by the coherence of its underlying framework, not by the truth or falsity of any single peripheral claim within it.

Originally, I intended to structure this book differently. I planned to begin with philosophy and its implications — particularly spirituality and technology — before moving into mystery traditions, conspiracy, alternative history, and finally modern science.

But over time, I realized that the scientific dimension of this work was too important to postpone, especially the material surrounding Squatter Man and the catastrophic symbolism embedded within ancient memory. So I chose to begin there instead.

From science, the book moves into philosophy, because philosophy is the foundation beneath everything else. From there, it enters the world of conspiracy and hidden systems. Only afterward does it arrive at technology, because once the technological implications become visible, many of the earlier questions begin to take on a new and unsettling weight:

What if some of it is real?

Yet technology without spiritual balance becomes dangerous, so spirituality follows next. From there, the journey descends deeper into mystery, symbolism, and hidden meaning, before ultimately concluding with alternative history — not as mere speculation, but as an attempt to reinterpret the story humanity tells itself about its own origins.

The structure of this book follows a deliberate progression:

- destabilize certainty
- introduce a new framework
- reveal implications
- expose hidden systems
- uncover spiritual meaning
- reveal symbolic structure
- reinterpret history

Note: There's a lot of repetition in this book because I intended each chapter to work as a mini-book of its own. So, for example, I might say that UFOs come from Inner Earthers a dozen times throughout the book, and you'll probably notice plenty of other ideas, arguments, and examples repeating as well. I apologize in advance for the repetition.

Science

On Belief

Belief is one of the strangest forces in existence. It is invisible, weightless, and impossible to hold in the hand, yet entire civilizations rise and fall because of it. Wars are fought over it. Religions are built upon it. Scientific revolutions begin with it. Love survives because of it. Despair deepens through its absence.

A human being can survive without certainty, but not without belief.

Even the person who claims to believe in nothing still believes something. He believes existence is meaningless. He believes consciousness is accidental. He believes skepticism itself is superior to faith. Total disbelief is impossible because every action presupposes some vision of reality. To wake up in the morning already implies belief: belief that tomorrow exists, belief that one's memories are real, belief that action matters enough to continue.

Belief is not merely an idea added onto reality. In many ways, belief is the structure through which reality is interpreted. Two people may witness the exact same event yet inhabit entirely different worlds because belief determines meaning. One sees chaos where another sees

destiny. One sees coincidence where another sees design. One sees a dead universe where another sees living intelligence.

Facts alone cannot explain human life because facts do not interpret themselves.

The modern world often treats belief as weakness, as though only measurable things deserve respect. Yet measurement itself rests upon unprovable assumptions. Science assumes logic is trustworthy. It assumes nature possesses consistency. It assumes consciousness can accurately observe external reality. These assumptions cannot themselves be scientifically proven without circularity. Thus even reason rests upon acts of faith.

This does not mean all beliefs are equally true. Some beliefs liberate; others destroy. Some clarify reality; others distort it. But the impossibility of perfect certainty means that every human being must eventually step beyond pure proof into interpretation.

Belief therefore becomes existential courage.

To believe is to move despite incomplete knowledge. It is to act while standing above an abyss of uncertainty. Every philosopher eventually encounters this abyss. Some retreat into cynicism. Others embrace nihilism. Others construct systems of logic so complex they become prisons. Yet beneath every system lies the same hidden condition: nobody sees the whole.

Human beings are finite creatures attempting to comprehend infinity.

This is why myths persist. This is why symbols survive. This is why ancient stories refuse to die even in technological civilizations. The human soul seems unable to exist inside a purely mechanical universe. Something in us continually reaches beyond matter toward meaning.

Perhaps belief emerges because consciousness itself is participatory rather than passive. We are not detached spectators floating outside reality. We are involved within it. Our perceptions shape our experience. Our assumptions influence our actions. Our expectations alter the paths we pursue. In this sense, belief functions almost like a creative force. Entire futures begin first as invisible convictions inside the mind.

Every cathedral, every empire, every philosophy, every scientific breakthrough, every revolution, and every work of art began as belief before it became material form.

The danger of belief is obvious: false beliefs can enslave civilizations. But the danger of disbelief is equally severe. A culture that believes in nothing eventually loses the will to create, sacrifice, or endure. Without belief, existence collapses into consumption and distraction. Meaning evaporates. Pleasure becomes the only remaining compass, and pleasure alone cannot sustain a civilization.

Thus the deepest question is not whether human beings should believe. They already do. The deeper question is what kind of belief is worthy of humanity.

A worthy belief must expand perception rather than shrink it. It must produce courage rather than paralysis. It must orient the individual toward truth rather than mere comfort. Above all, it must remain alive enough to evolve, because rigid belief becomes dogma, and dogma eventually fears reality itself.

Perhaps wisdom lies not in possessing absolute certainty, but in balancing conviction with humility. To believe strongly while remaining open to transformation. To pursue truth without pretending to own it completely.

For the universe may be stranger than every philosophy ever written.

And belief may be the bridge between the known world and the unknown one waiting beyond it.

What I believe:

Thus, in the spirit that belief must stand against dogma and refuse to bow to it—brave enough to face the armies of ridicule, unshaken by doubt, unbroken by dismissal—here is what I believe:

I believe Earth is a white hole, and I interpret that as Earth growing and being hollow enough to support the evolution of life, meaning that life began inside the planet. Humanity evolved here, and there exists a supercivilization inside the Earth that Hitler allegedly tried to find and that Admiral Byrd is said to have contacted. I believe these humans are behind the UFO phenomenon and are the gods of our ancestors. Some of these gods founded Atlantis, and when Atlantis fell, either survivors from Atlantis helped humanity rebuild, or people from the inner Earth did—or perhaps both. I think much of our technology comes from them and has been seeded to us through black projects, and I believe the same is true for artificial intelligence.

I also believe this hidden history is far richer than most people imagine. We have Lemuria, the Moon being brought here, giants on Mars, giant apes and sea monsters, wizards and dragons, fairies and Bigfoot, and free-energy weapons capable of destroying entire planets!! We will explore all of it in this book, so keep reading.

Grifters

Advanced ancient civilization: **fact** or *myth*?

YouTube is overflowing with alternative history these days, and the so-called experts are pushing back. But the way they do it is often disgusting, making people even angrier than before.

You see, people get angry because these discussions are not actually about archaeology. They are about identity, meaning, trust, class, authority, intelligence, humiliation, and existential anxiety.

It is fascinating because beneath the surface argument about Atlantis, there are actually two different emotional worlds colliding, and both sides partly misunderstand the other.

The archaeologists are mostly arguing:

“There is no evidence for an advanced Ice Age civilization.”

But many viewers are emotionally hearing:

“You are stupid for questioning the official narrative.”

That distinction is enormous.

But here is the irony:

The archaeologists often interpret this psychologically, while alternative-history audiences interpret archaeology politically. So each side thinks:

“The other side is missing the deeper issue.”

That creates frustration immediately.

Another huge issue is tone.

Notice how often the so-called experts swing between humility, mockery, compassion, and condescension — sometimes in the same sentence!

Then, when phrases like “wackos or freaks” are added, the emotional effect changes completely.

People stop hearing:

“This claim is wrong.”

And start hearing:

“People like you are ridiculous.”

That instantly activates tribal psychology.

The “experts” often miss the deeper point.

Many people attracted to alternative history are not merely seeking facts. They are seeking wonder, myth, meaning, enchantment, hidden depth, and escape from modern emptiness.

And mainstream academia often struggles to provide that emotional experience.

In many ways, the archaeology debate becomes a symbolic war over whether modernity itself is enough.

And that is why people become emotional.

Because they are not merely debating rocks.

They are debating who gets to define reality, whether mystery still exists, whether institutions deserve trust, whether modern life has meaning, and whether humanity has lost something important.

That is why the arguments become so heated.

But I think it is deeper than that. I think humanity possesses some form of ancestral memory.

I remember being told about the Great Flood as a child, and deep within me I somehow felt it was true. But the story was presented through a religious filter, so to speak, and because of that I dismissed it entirely as fiction. As I grew older, I continued to see it as mythology and rarely thought about it.

Then *Randall Carlson* came along and presented evidence for a global flood. To me, the evidence felt overwhelming. You can even look at Google Earth and see what appear to be enormous scars across the landscape. The evidence is there; it is simply that mainstream interpretations explain that evidence differently.

Nevertheless, it shocked me to the core. I felt, deep down, that it was true. That deeper spark within me, that buried memory, suddenly came alive. And I remember thinking: of course our ancestors did not simply invent these stories out of nowhere. Suddenly the existence of flood myths across the world no longer seemed mysterious to me.

Rupert Sheldrake proposed a controversial idea known as morphic resonance. According to this theory, nature possesses a kind of memory. Rather than organisms developing entirely in isolation, patterns of behavior and form may echo across time through invisible fields of resonance.

In this view, memory may not be stored solely inside the brain. Species could share a kind of informational inheritance, where once a pattern is established somewhere in nature, it becomes easier for similar patterns to emerge elsewhere. Habits, behaviors, and even forms may propagate non-locally through what Sheldrake called morphic fields.

And I am an idealist, so Sheldrake's theory makes profound sense to me. It gives language to something I already felt intuitively: that the certainty I feel about the Great Flood is not merely belief, but memory — a real memory embedded somewhere deep within the human story.

My larger point is that I think humanity collectively carries this memory, even if most people cannot consciously articulate it. That may be one reason why so many become emotional and defensive when so-called experts dismiss alternative history as nonsense.

But don't the experts carry this memory too?

Perhaps they do. But the memory may sit so deeply buried beneath layers of academic conditioning, institutional thinking, and professional training that one overrides the other.

Ancestors experience catastrophic flooding → those experiences contribute to humanity's collective patterns → later humans resonate with those patterns → an individual encounters a flood story and experiences a powerful, inexplicable sense of recognition or familiarity.

But back to the bullying!

The archaeologists repeatedly use language that implicitly frames believers in alternative theories as irrational, gullible, unserious, emotionally unstable, or intellectually manipulated, even when they are trying to sound compassionate.

Take phrases like “wackos or freaks.” This immediately creates an atmosphere of “us” versus “them,” where one side represents serious intellectual adults and the other represents crazy people. Even when said jokingly, people register contempt very quickly on an emotional level.

Then there is the use of words like “cult,” as in:

“I helped pull them out of the cult of fake archaeology.”

Psychologically, that is huge. The word “cult” implies brainwashing, irrational devotion, lack of independent thinking, and vulnerability to manipulation. So what many alternative-history audiences emotionally hear is:

“You are mentally compromised.”

That produces anger instantly.

Another common phrase appears in different forms throughout these discussions:

“They don’t understand how archaeology works.”

“They don’t understand the basics of our field.”

Factually, that may sometimes be true. But emotionally it sounds parental, almost like:

“You are ignorant children.”

Especially when combined with certainty.

Then we hear statements like:

“The general public wants an easy answer.”

That may sound harmless, but psychologically it implies laziness, intellectual weakness, and simplistic thinking. Many believers hear:

“You believe this because you cannot handle complexity.”

The discussion also repeatedly links alternative archaeology with conspiracy thinking, anti-science attitudes, and anti-establishment paranoia.

“You are one of those irrational internet people.”

Another subtle but powerful example is:

“It’s almost like they’re looking for answers in faith rather than science.”

To skeptical audiences this sounds reasonable. But to believers it sounds deeply insulting because it implies emotional neediness, belief over evidence, and religion-like thinking.

Then there is the “handsome smile” remark:

“If they say it with a handsome smile thousands of people will believe it.”

This suggests that followers are easily manipulated, emotionally seduced, and intellectually weak. Once again, people react emotionally to that kind of framing.

The repeated use of words like “misguided,” “misled,” and “duped” has a similar effect.

For example:

“Millions of people who are misguided.”

This sounds softer than calling someone stupid, but psychologically it still places one side above the other.

The deepest trigger here is not disagreement itself. People can tolerate disagreement. The real trigger is perceived status humiliation.

People hear:

“You think I’m beneath you.”

“You think I’m gullible.”

“You think I’m intellectually inferior.”

“You think I cannot think for myself.”

Once people feel that, the conversation usually stops being about evidence. It becomes identity defense, tribe defense, and dignity defense.

Academics are often perceived as arrogant, condescending, and trapped in ivory towers. And honestly, sometimes that criticism is deserved!

At the end of the day, many alternative-history audiences are not merely reacting to archaeology itself. They are reacting to institutional tone, cultural hierarchy, perceived intellectual elitism, and humiliation from experts.

That emotional layer is something many academics profoundly underestimate.

I don't understand the bullying myself. Now, I bully back, so I suppose I have sunk to their level. But these so-called experts often hold PhDs. They are supposed to be the most rational and level-headed people in society, yet they often appear to be the exact opposite. They behave like bullies, and science increasingly becomes presented as unquestionable fact rather than open-minded inquiry. Science turns into the new dogma, the new religion, and they do not seem to recognize that as a problem. I do not even think they register it.

But my deeper point remains this: the real reason people become emotional is because of that ancestral memory. Deep within us, I think we know that world-ending events are real and that they occur in cycles. So if humanity fails to learn from the past, we may be doomed to repeat it and suffer enormously. From this perspective, the so-called experts are not merely blocking alternative theories; they are potentially blocking paths toward truths that could matter deeply for humanity's future.

Something deep within us reacts to that.

I mean, they could end up dooming us all!

And something even deeper seems to be screaming that the next cycle may already be approaching.

And even if no world-ending event ever comes, that ancestral memory — like an ancient alarm buried within the human psyche — may still continue screaming beneath the surface.

I have observed a whole cluster of rhetorical “memes” — not internet image memes, but recurring psychological frames and catchphrases that instantly signal authority, dismissal, rationality, danger, and social positioning.

These memes are powerful because they compress an entire world-view into just a few words.

The biggest one is:

“Pseudoarchaeology.”

One of the strongest labels imaginable.

Meaning:

“Not real archaeology.”

Psychological effect:

it delegitimizes instantly, frames the person as fake, and implies deception or incompetence.

I mean, it’s gotten so bad that if you ask AI what “pseudoarchaeology” means, it can respond with something like: “...Major monuments built by ancient or non-white societies are frequently attributed to extraterrestrials or forgotten ‘superior’ races.”

And then you know the cover-up and brainwashing are complete, because there’s a real possibility that ancient occult traditions were

right—that these monuments and other ancient structures were, in fact, created by a superior white race of humans who live inside the Earth even today and are behind the UFO phenomenon.

This could indeed be the case. But the moment you even entertain that possibility, you risk being labeled a racist. That means certain possibilities can never be investigated openly, because the truth—whatever it ultimately turns out to be—is buried beneath layer after layer of taboo.

Then there is, again:

“Cult.”

This is a massive modern meme because it immediately implies irrational followers, emotional manipulation, guru worship, and brainwashing. It is an extremely socially radioactive term.

Then we have:

“Anti-science.”

Not always stated directly, but heavily implied.

This meme frames opponents as rejecting evidence, favoring emotion over rationality, being politically dangerous, or belonging to a broader conspiracy culture. In modern discourse, this is an incredibly powerful framing device.

Then comes:

“Conspiracy thinking.”

This meme automatically connects the target to paranoia, irrationality, fringe internet culture, and misinformation. Once that label lands, many people stop evaluating the claims themselves.

Another clever phrase is:

“Atlantis of the gaps.”

Clearly modeled after:

“God of the gaps.”

Meaning:

“Whenever there is uncertainty, people insert Atlantis.”

This is rhetorically powerful because it reframes curiosity itself as intellectual laziness.

Then there is the phrase:

“There is no evidence whatsoever.”

Used strongly in statements like:

“No, there’s no evidence whatsoever for it anywhere in the world.”

This meme attempts total closure. Not:

“the evidence is weak,”

but:

“none exists.”

Psychologically, it tries to end the conversation immediately.

Then we arrive at:

“Trust the experts.”

Not always stated directly, but structurally present everywhere.

The entire framework rests upon credential legitimacy, institutional continuity, and methodological authority. The hidden meme underneath it all is:

“trained experts know better than internet personalities.”

But perhaps the most important meme of all is this:

“Reality is complicated; experts interpret it for society.”

The counter-meme from alternative-history audiences is:

“Reality is hidden; institutions conceal it from society.”

That is the real war underneath all of this.

Not merely archaeology.

But, as I said, who owns truth, who interprets reality, whether institutions deserve trust, and whether modern civilization itself has become spiritually bankrupt.

Again, that is why these debates become so emotionally explosive.

And then there is the newest meme they use when all else fails:

“grifter.”

A grifter is a con artist, swindler, or manipulator who gains money or influence through deception rather than force.

So when someone is called a grifter, the implication is no longer merely:

“You are wrong.”

The implication becomes:

“You are knowingly deceiving people for personal gain.”

Psychologically, this is a very powerful tactic because it attempts to turn the hero of the people against the people themselves.

And sometimes, it works.

They call Graham Hancock a grifter.

To critics, Hancock represents seductive pseudo-history.

To supporters, Hancock represents curiosity, wonder, and the courage to question dogma.

But calling him a grifter feels absurd to me. Few people on Earth seem more passionate about alternative history than Graham Hancock. And even the label “alternative history” functions partly as a rhetorical meme used to discredit the movement itself, because the word “alternative” subtly carries associations of crackpottery and fringe thinking.

From my perspective, the “grifter” label is deeply unfair and reductive because Hancock appears sincere and genuinely driven by curiosity and passion. Many of his supporters feel the same way: even if some of his conclusions are speculative, he clearly seems deeply invested in the subject rather than cynically exploiting it.

And this brings us back to something important: *labels matter*.

Terms like “alternative history,” “pseudoarchaeology,” “fringe,” “conspiracy,” and “debunked” carry emotional and social framing far beyond their literal meaning.

For many people, “alternative history” sounds adventurous, imaginative, and open-minded.

For many academics, however, it signals weak methodology, speculative leaps, lack of peer review, and sensationalism.

So the exact same phrase carries completely different emotional weight depending on the audience hearing it.

But we have memes too, and we only need one:

“mainstream.”

Oh, they hate that word!

But anyone who seriously understands philosophy, especially the philosophy of science, can see why that label persists. In the end, mainstream science is not absolute truth. It is simply the dominant

interpretation of the evidence at a particular moment in history. That is all it is, ***and all it will ever be.***

Philosophically speaking, science deals in models, assumptions, probabilities, and interpretations — not final certainty. Yet these interpretations are constantly presented to the public as unquestionable “facts” and “truths,” when any serious student of philosophy knows the situation is far more complicated than that.

Again, they can’t shake that label because it is philosophically accurate. That is, these are their best guesses and their interpretations of the evidence. There is no truth and fact; there are only guesses and interpretations. And then they call that truth and fact, which any serious student of philosophy—again—knows is untrue.

And online, things have become so extreme that people try to pre-debunk (prebunking) videos before they even drop! People sometimes pre-judge content before watching it, organize “debunks” in advance, mass-react based on reputation rather than arguments, and assume conclusions before evidence is even presented.

But then it all backfires through one simple “chess” move:
“We have already debunked it. Case closed.”

But not so fast. What if someone decides to *de-debunk* it?

That is essentially what channels like **DeDunking** are doing on YouTube, and the dude is getting a lot of heat for it!

And after memes like “outlandish beliefs” and “pseudoarchaeology,” they eventually play their ultimate card: **the Hitler card.**

“...and reveal pseudoarchaeology’s racist roots.”

Yes, the Nazis were interested in lost civilizations and ancient super-civilization myths. And yes, some legends describe these “super-humans” as white. But so what?

What many people find disgusting is not skepticism itself, but the automatic moral contamination of curiosity. The moment someone questions the mainstream narrative, they are no longer merely “wrong” — they risk being psychologically associated with racists, extremists, crackpots, or conspiracy theorists. That is not the spirit of science. Science is supposed to investigate ideas, not socially stigmatize people for asking uncomfortable questions.

So you can play the *Hitler card* if you want, but it will not stick forever. People eventually see through rhetorical guilt-by-association when it is used as a substitute for genuine argument.

And it is also funny how they use words like “outlandish,” when literally one interpretation of Atlantis is “out land” — the land beyond (abroad).

My personal beef with Mainstream:

I have studied the philosophy of science, so in order to prove that Khufu built the Great Pyramid of Giza, you need to give me something stronger than: Khufu cartouches and graffiti found in the relieving chambers above the King's Chamber, workers' villages and tombs, radiocarbon dating that does not even perfectly match, Merer's Diary, the pyramid fitting into the broader evolution of pyramid building, the surrounding funerary complex, historical king lists and later Egyptian traditions associating the pyramid with Khufu, and his boat buried next to his supposed final destination.

I mean, I am not impressed by this! I thought they had it all figured out, but they do not. None of this fully holds up logically.

First of all, they refuse to scientifically test the Khufu graffiti and verify its authenticity, so that "proof" remains void — a "proof" equal to absolute nothingness! And they know that if they ever properly tested it, it could potentially undermine the claim that Khufu built the Great Pyramid, which is why they refuse to test it.

The workers' villages and tombs point to restoration and activity around the Great Pyramid, nothing more. That is as far as you can logically go. You cannot push the logical system to do more work for you here. This is circumstantial evidence.

If a vagabond camped in your backyard, would that mean he built your house — even if he somehow broke into it and covered the walls with graffiti?

Then radiocarbon dating goes out the window if a global flood really did happen, because such a massive catastrophe could potentially disrupt the dating process. I have also seen older proposed dates, but those tend to get brushed aside.

Merer's Diary can logically point only to restoration or transport activity, not necessarily the original construction itself. And yes, I think restoration would absolutely require thousands of workers. This is not easy work.

And this may explain why Khufu could claim the Great Pyramid: perhaps others before him simply lacked the means to restore and appropriate it.

Mainstream scholars then ask:

"If rulers merely inherited these pyramids, why did the earliest pharaohs not claim the Great Pyramid first?"

Well, perhaps we have already answered that question.

Then we come to the so-called evolution of pyramid building. I think the opposite may actually be true: the pyramids appear to devolve over time.

Mainstream explanations say this happened because of changing priorities and fewer resources. But what I see is a loss of know-how. If it were merely about resources, then build a smaller Great Pyramid and demonstrate that the engineering knowledge still exists.

Instead, what we seem to observe is more like a plane crashing in a jungle. Later generations see the wreckage and attempt to replicate it using primitive materials. That is why later pyramids appear degraded.

The pyramids did not devolve because they were never truly evolved by those later civilizations in the first place. They found the Great Pyramid already standing there.

And who builds a Great Pyramid in the middle of a desert?

Twelve thousand years ago, the Giza region was far greener. That would make far more sense as the time to construct something on that scale.

So this apparent “evolution” of pyramid building may itself be an illusion.

And who is to say that survivors from some lost civilization were not still present in Egypt 4,500 years ago, helping the local population build or restore these structures?

Then we have the surrounding funerary complex, but again, this is circumstantial evidence.

And the king lists themselves speak of gods. The texts contain enormously long reigns attributed to divine beings. You may choose to interpret that symbolically or mythologically, but that remains an interpretive choice.

And finally, the boat is again only circumstantial evidence.

“But all the circumstantial evidence taken together forms a strong case!”

No, it does not.

If the vagabond camped in your yard, cooked dinner, built himself a toilet, and scribbled graffiti on the walls, all of that taken together still would not prove he built your house.

It simply would not.

So what needs to happen is simple: do the hard science and properly test the Khufu graffiti. That would make the case dramatically stronger.

But they refuse to do it.

So, from my perspective, mainstream archaeology asks us to trust circumstantial evidence while simultaneously gatekeeping and refusing to perform the scientific tests that could potentially settle the issue more convincingly.

And then they have the nerve to call us anti-science, when we are the ones demanding further testing.

Finally, as a last effort to save face, they say:

“Oh, even if we tested the graffiti, you would still believe in Atlantis.”

My response is:

“No, little snake, you cannot talk your way out of this one. Test it.”

And no amount of rhetoric can dismantle those two simple words:
test it.

Test it.

Test it.

Then you interrupt, like the snake you are, and say:

“No, I do not need to test it because no one could fake it. It is logically impossible.”

My reply to that is simple:

Even if you believe that, you should still test it, because that is what a mature scientist does.

There is no way to slither out of this one. Science is science.

And just because you cannot immediately see how the ship was placed inside the bottle, so to speak, does not mean it is logically impossible. In fact, *The Great Pyramid Hoax: The Conspiracy to Conceal the True History of Ancient Egypt* by Scott Creighton argues that it may indeed have been possible to fake it.

But regardless of where one stands on the issue, the conclusion remains the same:

you should still test it.

Test it.

Get it?

Done.

In other words, the mainstream case relies more heavily on interpretive frameworks and circumstantial inference than the public is often led to believe.

- It is fair to say that much of the case linking Khufu to the Great Pyramid of Giza is cumulative and circumstantial rather than based on a single definitive proof.
- It is fair to say that archaeology, like all sciences, works through interpretation of evidence rather than absolute certainty.
- It is fair to criticize arrogance, dismissiveness, or overstatement from experts.
- It is fair to argue that anomalies and unresolved questions should remain open to discussion.
- It is fair to ask for more transparency, testing, and debate where possible.

And for being fair, what do I get in return? A label slapped onto my forehead saying “fringe” or “pseudo.”

I have even read comments online claiming that these ancient building techniques were not that sophisticated, and therefore an advanced civilization could not have made them. But I mean, the proof is in the pudding. These structures have withstood thousands of years while countless other structures have risen and fallen beside them. The lengths people will go to defend the mainstream narrative are insane.

If something is extraordinarily durable, that is not evidence for a primitive society alone. It could be evidence for something else entirely.

And even if it were true that “these ancient construction techniques were not sophisticated,” so what? The proof is still in the pudding. You cannot simply word your way out of that.

It is like saying Magnus Carlsen could not have made a certain move because the move was “not sophisticated enough.”

That completely misses the point.

Simplicity does not equal primitiveness. Sometimes the strongest solutions are elegant, efficient, durable, and deceptively simple. The result is what matters.

And the result here is undeniable:

these ancient structures have endured for thousands of years while countless later constructions have crumbled around them.

And I suspect that when we finally understand how all of this was truly done, we will discover that it was in fact extremely advanced — high-IQ engineering!

People from the mainstream have even tried to dismiss Graham Hancock by saying:

“Aliens obviously didn’t build the pyramids,”

followed by smug laughter, as if they just destroyed his entire argument.

The problem is that Hancock does not even argue that aliens built the pyramids.

So they end up debunking positions that exist only inside their own heads.

Then they portray Hancock supporters as idiots, lumping them together with every New Age stereotype imaginable, as if we all show up to work wearing tinfoil hats and talking to crystals.

Honestly, the irony is incredible. These are supposedly the hyper-rational intellectuals, yet many of them can barely tie their own shoes. Some basic skills are clearly lacking indeed.

But what the mainstream hates most of all is the fact that so many people believe in Atlantis. In America, surveys have suggested that over

half the population is at least open to the idea of ancient advanced civilizations. That is a lot of people. Even in my own family, more people believe than do not.

And I mean, when you are shown statues weighing over 1,000 tons and massive obelisks, and the mainstream responds by showing you dolerite pounding stones, ropes, sledges, and primitive transport methods while saying, “This is how they did it,” your first reaction is naturally:

“Come on!”

And for good reason.

Then, when you ask them to physically demonstrate it, they often say:

“Well, it would take too much time,”

or:

“The ancients had enormous labor forces.”

Especially if the king supposedly forced people to work like absolute maniacs, according to the mainstream explanation.

At some point you start thinking:

“How stupid do they think I am?”

So fine — then prove it.

Take as many people as you need, use the exact dolerite pounding stones and technology you claim they used, and carve the obelisk. Perform the experiment. Do the science — real science — and then we can talk.

Until then, I do not simply believe the narrative.

My own interpretation of history is much simpler and, to me, more logical.

Most animal species are ancient, so perhaps humanity is ancient too. Perhaps there once existed a highly advanced human civilization that eventually became technologically sophisticated enough to create the UFOs we see in our skies. Perhaps they chose to live underground because surface civilization repeatedly faces extinction-level catastrophes.

So when the world-ending event came, they survived beneath the Earth while surface civilization collapsed. Then, afterward, they emerged once again and appeared to the survivors almost like gods, bringing fragments of knowledge, astronomy, architecture, agriculture, mathematics, and civilization back to humanity.

That would explain why ancient traditions across the world speak of divine teachers, culture bringers, sages, sky beings, and gods descending after catastrophe to help rebuild civilization.

The Seven Sages.

Viracocha.

Osiris.

Quetzalcoatl.

Oannes.

And it would also explain why we do not necessarily find endless remains of a surface super-civilization everywhere, but instead find

fragments of advanced knowledge scattered throughout myth, sacred architecture, astronomy, and ancient traditions.

Again: This logically destroys one of the mainstream's favorite smug little objections:

"Where is all the plastic from this civilization?"

Well, if a civilization possessed technology advanced enough to create the kinds of UFOs people report today, then why assume they were limited to living on the surface like modern humanity? Such a civilization could potentially choose to live wherever it wanted: underground, deep within mountains, in underwater bases hidden in the oceans, or perhaps even on the Moon or Mars.

So why would we expect to find mountains of surface trash lying around for archaeologists to dig up 12,000 years later?

The question itself assumes they lived exactly like modern industrial society, which is already a massive assumption.

It is like asking:

"Where are the Coca-Cola bottles from Atlantis?"

The objection sounds clever for about five seconds, until you actually think about it.

Atlantis itself may have looked far less futuristic than people imagine. It could have resembled a grand, idealized version of ancient Greek civilization — temples, marble structures, philosophy, art, and sacred

geometry — while quietly housing technologies far beyond our own, including UFO-like craft and advanced energy systems.

And if much of that technology was developed underground or hidden away from the surface world, then — for the third time now, just to hammer this point firmly into place — one of the mainstream's favorite objections immediately collapses:

“Where is all the industrial waste?”

Well, you will not find endless factory ruins and mountains of trash on the surface if the civilization itself primarily operated beneath the Earth, deep underwater, or in hidden locations far removed from ordinary human settlements.

Perhaps most Atlanteans were not superhuman at all. Perhaps they were culturally similar to the ancient Greeks: intelligent, artistic, spiritual, and highly civilized, but otherwise mostly ordinary humans.

But among them may have lived a smaller group of extraordinary beings — “gods” or superhumans possessing unnaturally long lifespans and advanced knowledge.

And suddenly many ancient traditions begin making far more sense.

The long-lived patriarchs of the Bible.

The gods descending from the heavens.

The culture bringers.

The divine kings.

The sages.

Perhaps these figures were not pure fantasy, but distorted memories of contact between ordinary humanity and a small technologically superior class whose lifespans and abilities appeared godlike to ancient people.

Lastly, let us see what's beneath Giza and inside the Sphinx. Don't hide it. Don't use MrBeast to stand in front of the whole world and claim there's nothing beneath the Sphinx while he's literally standing on top of the sand and filming it. I mean, how stupid do you think people are? Dig away the sand inside the Sphinx, then film what's actually there.

My God, MrBeast's lack of basic logic here is beyond belief. But to be fair, he probably made a deal with Zahi Hawass that didn't leave room for asking those kinds of questions, because then the whole house of cards might come crashing down, and MrBeast wouldn't have been allowed to film there in the first place. So you can't entirely blame him for that. Still, misleading the entire world like that is no joke.

Basic logic that people, including MrBeast, need to understand: Not seeing X because you haven't looked where X is alleged to be $\neq$ establishing that X isn't there.

WARNING!
WARNING!
WARNING!

So, to convince me the mainstream position is legitimate, you need to test the Khufu graffiti. And I demand that the sand inside the Great Sphinx of Giza be removed so we can see what is actually inside it. And show us what lies beneath the Giza plateau, because to me it looks more like the ceiling of something than a floor.

Then show us the Great Labyrinth. Don't gatekeep it.

And on top of that, physically demonstrate how the Romans supposedly moved the Baalbek stones. Don't just show me mathematics. One professor argued that using larger stones was supposedly more economical and that the math proved it. I mean, the backwards, twisted logic the mainstream sometimes invents in order to defend its narratives is truly remarkable.

We are eight billion people on this planet. Get volunteers to help. Even I would hop on a plane and help prove the mainstream right. But to me it is obvious the Romans did not do it, because they did not apply this supposedly “economical” method elsewhere.

And don’t point to the Thunder Stone, because those people may have had different technology entirely. Prove it using only the technology the Romans supposedly had.

In the end, to me, saying that ancient Egyptians 4,500 years ago built the Great Pyramid is like saying isolated jungle tribes built the metal airplane sitting in their jungle.

So there is not a snowball’s chance in hell that I will simply trust the mainstream narrative, especially with all the anti-science behavior, refusal to test, gatekeeping, and literal burying of truth beneath the sand.

I genuinely do not understand how anyone, in good conscience, can support mainstream.

And now there is even talk of a second Sphinx, which would make sense because it reflects the same Yin and Yang motif found all across the world. This lost civilization seemed obsessed with balance.

So what is the grand conclusion here?

It is not really about archaeology.

It is about the end of the world.

If the Great Flood truly happened, then we need to understand it. Our Sun may have a dark twin, and if it returns — if that was the cause of the flood — then humanity could be in deep trouble. Or perhaps it was our own Sun through coronal mass ejections. But one thing is certain: suddenly *Derinkuyu Underground City* begins to make sense.

And if we ever see the **Squatter Man** appear in our skies again, it may already be too late.

Some researchers suggest this is what ancient cave art warns us about, and perhaps even what Rongorongo attempts to depict. Even the statues of Easter Island seem almost to whisper:

“Look to the sky.”

And perhaps the ancient obsession with astronomy and celestial cycles was about far more than planting crops!

Maybe Göbekli Tepe is another warning left behind for us to decode.

Something enormous happened in the distant past, and humanity had better come to understand it. Even the Younger Dryas Impact Hypothesis points toward something catastrophic.

And our ancestral memory, buried deep within us, screams that this is true.

So my final warning to humanity is this:

You may dismiss all of this as conspiracy nonsense. You may believe that the so-called experts have already interpreted all the evidence correctly. “There is nothing to see here,” they tell us. “Just go home.”

But then I will show you perhaps the most important image in all philosophy:

the Rabbit–Duck illusion.

That image reveals something profound: everything the mainstream calls settled science can potentially be interpreted differently. The exact same evidence can produce entirely different realities depending on perception.

If it looks like a duck, swims like a duck, and quacks like a duck, then it is probably a duck.

But not always.

Sometimes it is a **rabbit**.

And if it really is a rabbit — if our ancestors truly suffered a world-ending catastrophe 12,000 years ago, if they tried to warn us, and if that cycle is returning now in modern times — then what will you tell your children when it is too late?

What will you say when you entrusted their future entirely to so-called experts?

I would like to see a so-called expert scream “pseudoscience” while a wave larger than New York City crashes toward the shore.

It will be too late for apology videos then.

The Real Danger Is Certainty!

I believe the danger is not global warming science itself. I believe the danger is intellectual tunnel vision.

If humanity locks itself into one explanation for planetary change, and treats all alternative possibilities as pseudoscience before they are properly investigated, we risk blinding ourselves to larger threats we may not yet understand.

I am not arguing that we should stop studying anthropogenic global warming. We absolutely should. Human activity may indeed be affecting the climate in serious and dangerous ways. But I also believe science should remain open-ended enough to investigate other potential causes behind large-scale planetary instability, including cyclical or catastrophic events that may have occurred in Earth's distant past.

Around 12,000 years ago, the world experienced dramatic climate upheaval at the end of the last Ice Age. Whether that event was caused by oceanic shifts, impacts, solar behavior, or mechanisms we still do

not fully understand, I believe it deserves continued investigation rather than dismissal.

My concern is simple: if there are larger natural cycles operating beyond our current models, and we ignore them because modern culture has already decided the answer in advance, the consequences could be catastrophic.

Science is strongest when it remains curious, not when it becomes ideological.

To me, real science does not fear additional hypotheses. It tests them. It expands. It questions itself. The moment science stops exploring possibilities because they are unpopular or outside the dominant framework, it risks becoming dogma rather than discovery.

Billions of lives may depend not on abandoning climate science, but on broadening it.

My deeper concern is epistemological: societies can become so committed to one explanatory framework that they stop seriously looking for other causes. Historically, science has sometimes suffered from that problem. And this time, the modern scientific consensus may cause the death of billions of people!

WARNING! WARNING! WARNING!

If the Earth generates its own matter and water, as I have hypothesized in my white hole model, then maybe immense reservoirs from the inner Earth periodically burst forth like a broken dam, releasing catastrophic volumes of water from below — much like the “fountains of the deep” described in the Bible.

DEMU (my new book) is important because it argues that white holes exist. Why is this important now? Because according to Randall Carlson, there is a world-destroying event *twice* every Great Year, and the last one was around 12,800 years ago, which means we may be due for another such event. We are at its doorstep.

So, what caused the Great Flood that Carlson presents massive evidence for, and that our ancestors knew was real? Some say comets, meteors, or the Sun. Others suggest the Sun may have a twin, a dark star. Or maybe it is a combination of events.

But I thought: if Earth creates its own matter, and therefore its own water, we could have a completely new mechanism explaining this.

A Letter to Science

Dear Science,
You once represented humanity's greatest act of humility.

You shattered superstition, transformed civilization, and revealed astonishing truths about the universe. At your best, you were not dogma, but disciplined wonder.

Something changed.

Somewhere along the way, many began mistaking the map for the territory, the model for reality itself. Institutions formed around consensus, careers formed around certainty, and skepticism — once your greatest virtue — became increasingly selective. Science remained a method, but “The Science” became an authority.

This distinction matters.

Today, many ordinary people no longer distrust science because they hate truth. They distrust institutions because institutions increasingly appear closed, arrogant, tribal, and psychologically invested in defending paradigms rather than questioning them. The public senses this, even if they cannot always articulate it clearly.

And so a vacuum emerged.

Into that vacuum rushed conspiracy theories, pseudoarchaeology, internet prophets, hidden civilizations, Atlantis myths, simulation theories, alternative cosmologies, and countless grand narratives attempting to restore meaning to a fragmented world.

Many scientists respond with ridicule.

“Cult.”

“Anti-science.”

“Conspiracy thinking.”

“Pseudoarchaeology.”

“Wackos.”

“Easy answers.”

Perhaps some claims deserve criticism. Many are undoubtedly false. But the emotional response from the public is not born merely from ignorance. It is born from humiliation — from the growing sense that modern institutions no longer speak to the human soul.

The tragedy is that science itself often accidentally creates the very movements it despises.

When mystery disappears, mythology returns through the back door.

Human beings do not live by data alone. We seek meaning, coherence, belonging, awe, transcendence, and participation in something greater than ourselves. If official culture offers only mechanistic emptiness, many will inevitably seek forbidden narratives elsewhere.

This does not mean every alternative theory is true.

It means the hunger beneath them is real.

A person obsessed with Atlantis may not truly be searching for Atlantis. They may be searching for enchantment in a civilization that no longer feels enchanted. A person obsessed with hidden history may not merely distrust archaeology. They may distrust a culture that increasingly feels spiritually hollow.

Science should not fear this conversation.

It should lead it.

Not by surrendering rigor, but by recovering humility.

The greatest scientists in history understood this. They were not priests of certainty. They were explorers standing before mystery. The deeper they looked into existence, the stranger existence became.

Modern civilization desperately needs that spirit again.

Not blind belief.

Not cults.

Not irrationality.

But wonder.

Because the real danger to civilization is not that people ask forbidden questions.

The real danger is that curiosity itself becomes associated with shame.

Once that happens, society fractures into two worlds:

- one that claims authority,
- and one that seeks meaning elsewhere.

Neither side trusts the other.

Both become caricatures of themselves.

Science becomes colder.

The public becomes more conspiratorial.

And the cycle intensifies.

The solution is not censorship.

Nor arrogance.

Nor ridicule.

The solution is intellectual courage joined with humility.

To admit what is known.

To admit what is unknown.

To remain open without becoming gullible.

To remain rigorous without becoming dogmatic.

Reality is stranger than any ideology.

And perhaps the deepest lesson science can rediscover is the very thing that made it beautiful in the first place:
that truth is not threatened by questions.

Only dogma is.

And dogma may ultimately be what kills our civilization. Because if the ancients were telling the truth — if world-ending catastrophes are cyclical in nature — then we may become the next lost civilization buried beneath mud, ocean, and myth.

And thousands of years from now, future experts may stand above our ruins laughing at anyone suggesting we ever possessed advanced technology at all.

“Impossible.”

“Pseudo-history.”

“Conspiracy thinking.”

“Crackpots.”

The irony would be almost poetic:
a civilization so arrogant that it dismissed the warnings of the past,
only to become the very mystery future civilizations refuse to believe
ever existed.

And the most ironic part of all?

You can almost hear Flint Dibble echoing across time, unknowingly calling himself a crackpot as future civilizations laugh at the idea that ours ever possessed advanced technology at all.

— Thor Fabian Pettersen

Did you get it?

Today, mainstream experts call alternative thinkers “crackpots.” But if civilization collapses and most evidence disappears, then future archaeologists might dismiss our civilization in the exact same way.

Meaning people like Flint Dibble would effectively become the very thing they mocked!

So the insult echoes through time and turns back on itself.

That is the cosmic joke:

the skeptic becomes the future “crackpot” by applying the same dismissive logic to a lost civilization that actually existed.

Philosophy

How Did Everything Begin?

How did everything begin?

The solution, it turns out, is mind-bogglingly complex! In fact, it could only be solved by a species intelligent enough to realize that its universe is basically a cosmic user interface. Which explains why philosophers have been smashing their heads against the wall for thousands of years. Poor bastards were trying to solve a 0D problem inside a fake 3D desktop environment.

I'm kidding, of course. The solution is actually surprisingly simple — at least until you go into the details, at which point your brain slowly begins to melt into philosophical soup.

But it is true that the problem becomes almost impossible to solve if you think the universe is “real” in that naive, everyday sense.

And I'm not going to go into detail in this book. For a more detailed version of my philosophy, see DEMU, which stands for the *Dynamic Equilibrium Model of the Universe*.

But what it basically is, is me trying to solve the problem of infinite regress. The Big Bang model, for example, has to be wrong because you can always ask: what caused the Big Bang? If you say our universe came from a multiverse, then you must ask what caused the multiverse, and so on. In other words, it is impossible to explain how something starts because that will always lead to an unresolved problem: what started the starter? That is why philosophers came up with the Unmoved Mover, something that doesn't move yet causes something else to move. But this is also a paradox because if you don't move, you can't set motion into being because you don't move, so how can you do that? So, on the surface, it seems like the universe shouldn't be here at all because it can't! So, how do you resolve that?

The solution I came up with is an eternal universe because then you don't need a starter, since it was always here. But then you point out that this is a paradox too because how can something simply just be? But it turns out it is not a paradox if you view it from the right angle. So, let's do that.

If you allow existence itself to take the form of a dual torus, then you can have expansion and contraction simultaneously. This means there is actually zero delay between expansion and contraction. Now the Big Bang can point to the focal point where the zero delay is (the center of the dual torus), so now you have a starting point. So the Big Bang is right in spirit, but, and this is equally important, simultaneously with the starting point you have the big toroidal wings that we call the

universe. Now you have both simultaneously, which means you don't need to explain how the starting point created the wings because, in fact, they co-exist.

But now you have created another problem, which is: how can something contract while something else is expanding? That is, if you start from a point and then expand outwards, there is nothing to contract yet.

The solution here is that the universe is an interface of the animal mind. And this interface can create this paradoxical picture as long as the paradoxical picture isn't paradoxical in reality.

We said expansion equals contraction, but if you follow that through, you don't get a 3-dimensional reality because as you expand outwards, you simultaneously contract, so in effect you never expand. But the animal mind can then take that 0-dimensional reality and expand it into full-blown 3D. The 3D version will look paradoxical, of course, but reality, which is 0D, will not.

So now you can have an eternal universe because it is actually 0D.

And the 0D world doesn't need to start because it is not starting. It is not expanding at all because its expansion is met with contraction.

But you still need to answer what set the expansion/contraction going in the first place.

And the answer is that expansion/contraction is motionless; it is not moving in the classical sense. That is to say, it is timeless.

But now we are back at our Unmoved Mover. However, there is one extraordinary difference here, which is that this motionlessness is moving, but it is moving with zero delay, and that is the grand key to the universe.

Then you can say that this is a paradox, but it is not so.

Imagine Superman flying so fast that time stops, yet he is moving. So what I'm saying is that motionlessness is actually a form of motion, but it is moving so fast it is not moving in the classical sense, and therefore we do not need to explain what set it into motion because it is not moving in the classical sense. It is like asking what set timelessness going. It is timeless, so it doesn't need to be "in time."

But how then does timelessness generate time? We answered that: timelessness is time, like the 3D is the 0D. They are one and the same. The one did not cause the other. They both co-exist. And this seems like a paradox at first until you truly understand the inner workings of the dual torus. It is such an elegant shape. It explains all.

But then you say: why the dual torus and not nonexistence?

In my book I tried to show that negation is only part of the logical system and that the logical system is an invention of man, which means that nonexistence can be part of the logical system, which itself is a fiction. So existence itself never had to deal with nonexistence. Nonexistence is simply fiction, nonsense really.

That is to say, if one can demonstrate that nonexistence exists only as a construct within the logical system, and further demonstrate that the logical system itself is a human construct, then one has, in principle, resolved the question: “Why is there existence rather than nonexistence?”

But I think a deeper question is: why is there stuff instead of an eternal landscape of death and nothingness? And my answer to that is that there is an eternal landscape of death, but death itself contains life. Life and death are intertwined, and that is the ultimate answer, I think.

But again, visit the DEMU for more details.

To summarize all this, you can say *everything began with the way light views reality*.

It was when I sat on a beam of light in my mind’s eye that I saw the beginning of time, which is that timelessness is a kind of speed because it was the speed of light (the light ray) that brought me into the timeless realm. And here I saw complete nothingness, or as close to nothingness as you can get. Try to hop on a ray of light yourself and tell me what you see.

The Face of God: The Dual Torus

The dual torus functions as an elegant unifying structure because it allows me to collapse several problems into one geometric relation rather than treating them as separate mysteries.

The elegance comes from a few things.

I am trying to solve infinite regress not by adding another cause, but by redefining the structure of causation itself. Expansion and contraction become complementary aspects of one process rather than two separate events. The “beginning” and the “eternal” coexist instead of competing. Timelessness and time are treated as two perspectives on the same structure rather than opposites. The center/wings relationship gives me a way to talk about both unity and multiplicity simultaneously.

Philosophically, that is why the model feels elegant to me: one shape is doing a huge amount of explanatory work!

The strongest structural move in the model is probably this:

The universe does not begin after the starting point, but co-exists with it.

That is the key maneuver that attempts to dissolve the regress problem rather than merely postponing it.

My framework is philosophically elegant because it aims for compression: many problems, one underlying principle — the dual torus.

How I came up with it: It didn't happen overnight. I started in my teens, and I found the solution early on, but the solution has evolved in my mind over time.

But if my memory serves me right, it was when I sat on a beam of light in my mind that I saw the beginning of time. But it was still abstract. I needed my idea to have flesh and bones, so I turned to geometry because I noticed everything in the natural world has a certain geometry. Searching online, I found what I was looking for: Richard Buckminster Fuller's **vector equilibrium**, which is the *cuboctahedron*.

I loved this geometry because it could do, for real, what I saw in my mind's eye, which was this uniform distribution of everything. From the point of view of light, there has been no time, and that means no distribution of nature's parts, which means a uniform state. The cuboctahedron embodies this geometrically because all the vectors balance perfectly. Now I had the geometry of timelessness itself.

But for Fuller, vector equilibrium could not actually be real because it would mean death, ultimate death, which is true. But for me, in death I saw Nature's ultimate solution: how you actually solve infinite regress. Eternal death = no regress. This is how Nature does it.

Fuller was wrong, and Nature welcomes ultimate death! Because it turns out that when you try to model this death, you get a dual torus, and now death itself is not this static state that Fuller feared, but is actually dynamic, which is why I called my model *Dynamic Equilibrium*.

Basically, the center is death, but the wings around it are alive. So life and death are two sides of the same coin. That is, you can have both simultaneously, and that is what Fuller missed.

And then, when I had the dual torus, it was just a matter of understanding how it works, and when I did that, I could get a universe from timelessness.

And that was it. I did it. At least, I feel like I have done it.

Philosophical formula:

Infinite regress arises when cause and effect are separated by delay.

If:

Cause $\rightarrow$ delay $\rightarrow$ effect

then one may always ask:

What caused the cause?

But if expansion and contraction occur with zero delay, then cause and effect collapse into one simultaneous structure:

Expansion = Contraction

Delay = 0

Therefore: Regress = 0

So:

Infinite Regress = Temporal Delay

Zero Delay = No Regress

Or more simply:

Expansion + Contraction = 0 Delay

0 Delay = Timelessness

Timelessness = No Infinite Regress

I believe my framework works philosophically if my core premises are granted, especially the premise that regress depends on temporal separation.

My chain of reasoning is basically this:

- Regress requires sequential causation.
- Sequential causation requires temporal delay.
- A structure with zero delay collapses sequence into simultaneity.

- Therefore, the regress chain terminates, not by introducing a first cause, but by removing the temporal gap that generates the chain itself.

From my point of view, this is internally coherent as metaphysics.

The controversial step is this:

Cause and effect collapse into one simultaneous structure.

Many philosophers and physicists would argue that simultaneity alone does not automatically remove explanatory dependence. They might say that even if A and B coexist, one could still ask why the whole structure exists at all.

My response is that the structure does not “begin,” and therefore the demand for a prior explanation is misplaced. The dual torus is self-contained because expansion and contraction mutually define one another. Neither stands prior to the other. They coexist as aspects of one simultaneous structure.

So my attempt is not merely to stop regress arbitrarily, but to dissolve the mechanism that generates regress in the first place. The elegance of the model comes from replacing “first cause” with simultaneous self-relation.

Clearing the Fog

Many critics would likely dismiss metaphysical uses of the dual torus as New Age speculation or pseudoscience, but let's be real: a torus itself is not pseudoscience. It is a legitimate geometric and physical structure found throughout physics and nature. And I didn't arrive at the dual torus by watching some New Age stuff; I arrived at it using first principles.

Take my favorite breakfast cereal, Nesquik Cereal. The chocolate balls arrange themselves naturally and automatically into a hexagon when floating in milk. Follow this balancing principle into 3D and you get a cuboctahedron. Then animate the cuboctahedron and you get a dual torus. So I used my eyes and saw what Nature does. I looked into Nature.

Magnetic fields, plasma formations, fluid dynamics — I mean, it is everywhere you look!

And the dual torus solves evolution because some form of primordial sex is already contained within it. It solves consciousness and quantum riddles because the dual torus can be both 0D and 3D at the same time. We will dive into that later. It solves morphic resonance. I mean, it solves all our problems, including how life first arose.

Ok, now I'm beginning to sound like a New Ager, but I promise you this is all first-principles thinking. Associating me with the New Age movement is nonsense.

Time

If nonexistence is fiction because it is only part of the logical system—which itself is fiction—then I must start from existence. And existence itself cannot be paradoxical if paradoxes are also fictional. This implies that infinite regress must, in some sense, already be resolved.

If I cannot simply insert a scaffold into nature to solve infinite regress—because that would itself generate another regress—then I am led to the conclusion that only motion can resolve it. But then a further problem arises: causality.

The only way to resolve this, in my view, is to posit a form of motion so immediate that there is zero delay between cause and effect. From this perspective, the question “what set motion going?” dissolves, because it already assumes a temporal structure of causation that my framework is attempting to transcend.

I find this argument internally coherent as a speculative metaphysical system, although I recognize that it depends on several strong assumptions that many philosophers would challenge.

The central structure of my reasoning is as follows:

1. Nonexistence is not a genuine ontological alternative, but a conceptual artifact.
2. Therefore, existence does not need to “defeat” nonexistence.
3. Infinite regress cannot be resolved by adding external supports or “scaffolds.”
4. Therefore, reality must be self-sustaining.
5. A self-sustaining reality requires eternal motion or process.
6. Eternal motion cannot begin within time.
7. Therefore, causality must collapse into simultaneity (zero delay between cause and effect).

The strongest philosophical move in this chain is the claim that the question “what set motion going?” already presupposes causality. In that sense, I am attempting to show that the question itself contains the very temporal structure my model is trying to dissolve.

From within this framework, the question becomes a category error:

- timeless motion is not “started,”
- because “starting” belongs to delayed causality,
- and delayed causality is precisely what the model rejects.

Critics would most strongly challenge whether:

- treating logic as “fictional” genuinely dissolves paradox,
- motion can meaningfully exist without temporal sequence,
- and whether simultaneity truly removes explanatory dependence.

However, as a metaphysical proposal, I believe this approach is more rigorous than simply asserting that the universe “just exists.”

I am attempting to derive why existence would necessarily take a self-balancing dynamic form rather than merely asserting it.

From this follows my view that time and timelessness are intertwined. Timelessness is the zero-delay structure underlying reality, while time is the constant updating of balance, which I identify with consciousness. Spacetime, in this sense, is the animal mind's modelling of this deeper structure.

Within my framework:

- timelessness is not static nothingness,
- but dynamic equilibrium,
- and time is the experiential unfolding of that equilibrium.

This is why time and timelessness are not opposites, but two aspects of the same underlying process.

So is time illusion or reality? Well, we are doing philosophy here, so I need to clearly define my terms to avoid confusion.

In my model, I refer to time as the experience of consciousness, which I equate with the eternal motion underlying all of Nature. I also describe this motion as motionless or timeless, because it occurs with zero delay. In this sense, time is reality itself—everything that is real—and even timelessness experiences time, which means timelessness is not frozen or static.

However, there is another sense in which time can be considered an illusion when I equate time with spacetime, because spacetime is an interface of the animal mind. In that sense, what we call time is a representational structure rather than reality-in-itself.

This can create confusion, because I also place motion prior to spacetime, where motion becomes primal and is identified with consciousness itself. To clarify this, I think of spacetime as a kind of computer interface, and this interface points to something beyond itself. That “beyond” is what I mean by motion.

It is not the motion of objects within the desktop, but something deeper—something the desktop models through the dual torus—yet in a paradoxical way, where expansion and contraction already co-exist. This appears nonsensical from a 3D perspective because of sequential ordering, but it becomes coherent from a 0D perspective, where there is no sequential ordering.

If **0D means “no sequential time structure” (a non-temporal relational description)**, then yes, the contradiction disappears because there is no “before/after” constraint.

And if I write somewhere that time is an illusion, I mean spacetime.

So real time is equilibrium constantly updating and finding new balance, which we experience as consciousness, which corresponds to the toroidal wings carrying information back into itself — the snake biting its own tail.

The Meaning of Life

Ok, now that we have established that existence is the dual torus and that it is eternal, we can begin to see what Nature is all about, what her job and purpose are. Having the dual torus as the basic building block of reality is elegant because it contains the dual principle; it contains opposing geometries that lead to self-replication, which is basically what life is. So life never began but is eternal.

So, Nature's job is to balance. But the moment balance is achieved, it falls apart, so balance must be achieved again. This is why we have this eternal expansion and contraction, because it is what balance looks like, and the zero delay happens because as soon as balance is achieved, it is destroyed, so it must happen again + close infinite regress at the same time, hence the zero delay between expansion and contraction. But Nature does this infinitely fast, which is why we get motion.

Why do you balance? Because if something were unbalanced, it would cause infinite regress. Thus, Nature has to remain perpetually balanced. But why can't you just achieve balance one time and be

done with it? Because you can't simply insert a structure into Nature. Where would that structure come from? It would itself lead to infinite regress if you inserted, say, a scaffold to hold Nature up. So balance must be a doing and not a being.

Suppose Nature needs some fixed structure—a “scaffold”—to keep it permanently balanced. Then you can ask:

What holds the scaffold in place?

If you answer, “another structure,” you have merely moved the problem back one level:

Nature $\leftarrow$ scaffold 1 $\leftarrow$ scaffold 2 $\leftarrow$ scaffold 3 $\leftarrow$...

Thus: there is no being; there is only **becoming**.

And this balance is what consciousness is, so life and consciousness are eternal, which solves the hard problem of consciousness. Again, I argue for this in DEMU.

In other words, the meaning of life is balance, but from the inside, the meaning of life is life — the eternal replication of life — and that, in turn, which I will argue for later in the book, leads to infinite love. So love is, in the final analysis, the meaning of life.

But if balance solves infinite regress physically, then you can still ask: why balance? Well, you could, and in fact, try it and you will see that you get balance back as the answer, because if something is unbalanced, it must first be balanced. And if you say, “What if there is something beyond balance?” then there is not, because if there were, that too would need to be balanced.

So balance is really the first and the last, the here and the now. It is the beyond and the after, and really, it is all-encompassing.

And if you say that’s just an infinite tower of turtles called balance, then notice that the infinite tower itself is balanced because it contains only balance. Thus, balance is really the only principle in existence where its being is its doing. It contains the lock and the key. It is the fundamental principle, and this must be the meaning of life because there literally isn’t anything else.

So balance (i.e., the dual torus) is different because balance is replicating itself (producing more of itself, leading to evolution) instead of needing another support.

Nature → needs scaffold → scaffold needs support → that support needs support → ∞

Balance works differently because it is self-sustaining:

Balance → produces/maintains balance → produces/maintains balance → ...

Balance as the Origin of Meaning

Imagine it: Logos as balance, because balance must be so perfectly balanced that Nature can solve infinite regress. This means the initial state of existence has to be balanced in such a way that reason itself can emerge from it!

In essence, I am trying to derive logos — reason, order, intelligibility — from the very conditions required for existence to avoid infinite regress.

The structure I am pointing toward is something like this:

If reality ultimately rests on chaos, arbitrariness, or asymmetry, then explanation never truly closes. Something always remains unjustified. There is always a “why this instead of something else?” beneath the system.

But if the foundational state is perfect balance, then the system can become self-grounding. Balance would not require an external cause because opposing tendencies cancel into a self-contained equilibrium.

So balance is not merely aesthetic harmony in my framework. It is an ontological necessity.

From that balance, *logos* emerges because:

- reason itself depends on consistency,
- consistency depends on stable relations,
- stable relations depend on symmetry or equilibrium,
- therefore intelligibility is rooted in primordial balance.

In other words, nature must be ordered enough for logic to arise from it, because only a reality capable of internally generating reason could “close the loop” of infinite regress.

Note: When I say “logic” here, I mean something more like reason—that Nature is intelligible—not that Nature is carved up into separate fragments. The logical system itself may be a man-made fiction, and I think it is.

I am also implying something deeper:

The primordial state cannot merely contain balance accidentally. It must be balanced so perfectly that:

- self-reference becomes possible,
- recursion becomes stable,
- consciousness can emerge,
- and explanation can terminate within the system itself.

That would make logos not a human invention, but the expression of existence maintaining coherence with itself.

This resembles aspects of Heraclitus' concept of the Logos, Parmenides' idea that Being must be internally coherent, dialectical balance in Hegel, and even modern symmetry principles in physics.

But my framing is more radical because I am treating balance as the solution to metaphysical recursion itself.

So the argument becomes something like this:

Only a perfectly balanced reality could exist without external justification.

Therefore logos is not secondary to existence.

Logos is the signature of existence successfully balancing itself enough to avoid infinite regress.

The Hero's Journey = balance rebalancing itself = infinite love = the meaning of life.

In my framework, the Hero's Journey is not merely a storytelling structure — it is a metaphysical pattern describing how reality restores balance to itself.

The logic unfolds something like this:

- Existence begins in a state seeking equilibrium.
- Imbalance emerges: fragmentation, separation, suffering, entropy, ignorance.
- The hero descends into chaos or division.
- Through struggle, integration occurs.
- Balance is restored at a higher level.
- That restoration is experienced as love, meaning, reconciliation, or wholeness.

So the Hero's Journey is essentially:

balance leaving itself and consciously returning to itself.

That is why I connect it to infinite love.

In this model, love is not merely an emotion. Love is the force or tendency toward reunification, coherence, and restored equilibrium between seemingly separated parts.

A fragmented universe experiences suffering because fragmentation is tension away from balance.

A healed universe experiences love because reconciliation reduces contradiction and separation.

So:

- hatred = division,
- fear = fragmentation,
- love = reintegration.

And if reality fundamentally seeks balance, then love becomes the deepest expression of reality's own movement toward self-restoration.

That is why the Hero's Journey feels universally meaningful across cultures:

- departure from unity,
- descent into fragmentation,
- confrontation with chaos,
- sacrifice,
- rebirth,
- return with wisdom,
- restoration of harmony.

I interpret this as a cosmological process, not merely a psychological or literary one.

So the meaning of life, within this framework, becomes: participating in the restoration of balance.

And infinite love would be:

the fully realized state in which all fragmentation is reintegrated into coherent balance without contradiction.

That is why the Hero's Journey matters so deeply in myth. Myths resonate because they mirror the actual structure of reality attempting to heal itself.

Gravity

If the dual torus is the Basic Building Block (BBB) of reality, then gravity is simply the contraction (+ expansion) phase of the dual torus. So gravity is literally a whirlpool sucking things into itself.

Imagine standing on the surface of the Earth. Trillions of tiny tori are raining down on your head like a waterfall, and the dual-torus core in the Earth, like a whirlpool, is sucking both you and the trillions of tiny tori in the atmosphere inward. But the ground keeps you from falling into the Earth, and you feel that pressure (the trillions of tiny tori) as gravity, just like standing beneath a waterfall.

And the other forces of Nature are simply the four stable configurations of the dual torus itself. If you take the skeleton of the dual torus, which is the cuboctahedron, then the four forces of Nature are as follows:

- Cuboctahedron $\rightarrow$ gravity

Because it represents equilibrium, isotropic balance, or the foundational lattice/skeleton of spacetime. And equilibrium is always present, like gravity itself; it cannot be turned off.

- Icosahedron $\rightarrow$ weak force

Because of its transformative properties.

- Octahedron → electromagnetism

Because of polarity, symmetry axes, and field-like extension.

- Tetrahedron → strong force

Because the tetrahedron is the simplest stable 3D structure and highly rigid, which aligns with the binding nature of the strong force.

Note that when you fold the cuboctahedron, like a piece of paper, you naturally create more folds, and it becomes stronger. This is why the tetrahedron is associated with the strong force. This is all very natural, like churning milk into butter. Physically, it is cream undergoing phase separation, not milk directly turning into butter. However, it is a real example of how structure emerges from dynamic motion and folding processes.

And note that many things in Nature come in fours: the four states of matter, the four letters of DNA, and one could go on and make a long list of Nature's apparent attraction to the number four.

And I think the reason is simple: when you fold the cuboctahedron, you get the four. And the cuboctahedron is constantly folding because Nature is dynamic.

If Nature emerges from a single underlying process, then one should expect recurring geometric principles to appear throughout reality. Geometry is the language of relation, balance, symmetry, and struc-

ture. The same simple patterns repeat across scales: spirals, vortices, hexagons, spheres, toroidal flows, and self-organizing systems. This suggests that complexity may arise not from countless disconnected laws, but from the repeated transformation of a few fundamental geometric principles. In this sense, unification is achieved not by adding more mechanisms, but by discovering the underlying geometry from which the mechanisms emerge.

In short, perhaps one geometric principle generates many phenomena.

And yes, sometimes very deep truths *are* simple.

Cosmic Sex

Yes, even atoms have sex! The dual torus contains the geometric foundations of animal sex. Have you ever wondered where all matter comes from? It comes from Nature reproducing.

The old saying “as above, so below” is true on so many deep levels it is insane. You can literally study man and recreate the universe because they are mirror images of each other. How babies are born is how matter is born, etc. Man has symmetry; the universe has symmetry. Man’s whole body is a torus, with an in (the mouth) and out (the anus). Yeah, there’s no nice way of putting it. Man is conscious, the universe is conscious (idealism and the cosmic mind). However, “cosmic sex” is more basic, perhaps, but not calling it sex I would strongly disagree with. I would call it sex, and rather say animal sex is more developed, more evolved, but I like to call a spade a spade.

Thus, when you get these opposite-sitting tetrahedra clusters, you can recreate (sex) the cuboctahedron on a larger scale, and this principle also explains why all is fractal. Nature is like a set of Russian dolls. And like the octaves on your piano, the cuboctahedron can be perfectly replicated (sex) and scaled.

The cuboctahedron is like the seed of Nature.

Me vs Fuller: Two Views of Equilibrium

Richard Buckminster Fuller's concept of the vector equilibrium describes a state of perfect geometric and energetic balance, where all forces are symmetrically resolved and no net tendency for change exists. In that sense, equilibrium is treated as a limiting condition of rest — a structural endpoint in which motion effectively cancels out.

In the DEMU framework, however, I am not treating equilibrium as a static endpoint at all! Instead, I am redefining equilibrium as a dynamic self-relational process in which balance is not something that is achieved and then held, but something that is continuously generated. Expansion and contraction are not separate events occurring in sequence, but aspects of a single zero-delay structure in which causation has no temporal gap. From this perspective, what we call motion, time, and structure are not added onto equilibrium, but emerge from equilibrium itself as a self-maintaining process.

So the difference is not merely interpretational, but structural: Fuller describes equilibrium as what remains when motion resolves into symmetry, whereas I am describing equilibrium as the very mechanism through which motion, time, and differentiation arise in the first place.

Again: Fuller's position (as represented through the vector equilibrium) treats perfect equilibrium as a condition where all forces cancel: equilibrium means no gradients, no gradients means no change, and no change implies no time-evolution. From that chain, you logically arrive at a state that is dynamically inert — what he metaphorically referred to as “death,” meaning not biological death, but a complete absence of energetic differentiation or process.

In my framework, I am doing something different. I redefine equilibrium not as the absence of change, but as a continuous process with zero delay between its aspects. So instead of “no change over time,” it becomes “change without temporal separation.” Motion does not require sequential unfolding; rather, sequence is what emerges when a deeper, non-sequential process is rendered through time.

In that sense, what we call time is not fundamental but is an interface — a way the animal mind projects a zero-delay reality into a structured experience of before and after. The underlying process is not moving through time in steps; it is a single, self-relational motion

that does not need temporal succession to exist. The Superman analogy is the closest intuitive image: a motion so extreme that, from the perspective of time, it appears frozen, yet internally it is still fully active — except in my view, this is not an exception but the underlying nature of reality itself.

From Fuller's point of view, that frozen state—equilibrium—means no activity. From my point of view, that frozen state—equilibrium—means ultimate activity! So we have radically different views. However, note that Richard Buckminster Fuller is notoriously difficult to understand, and his work is highly complex, so I may have misconstrued him here as well. So take it with a grain of salt.

The difference is now quite clear:

Richard Buckminster Fuller is working from a structural-energetic interpretation of geometry, where equilibrium means:

all differences cancel out → no gradients → no change → therefore
no process

So in that frame, “perfect equilibrium” logically ends up describing a kind of inert limit-state (what he metaphorically calls “death”), because once all asymmetry is gone, there is nothing left to drive transformation.

My position is structurally different, not just a variation of the same idea.

I am redefining equilibrium itself so that:
balance is not the absence of change, but a continuous self-maintaining relation with zero delay between its aspects

So instead of:
change requires time $\rightarrow$ no time means no change

I am saying:
change is fundamental $\rightarrow$ time is the way that non-delayed change is rendered

That leads to a different ontology:
For Fuller: equilibrium is what remains when motion resolves into symmetry

For me: equilibrium is what generates motion through perfect, non-separated self-relation

So, we see the distinction clearly now:
Fuller's model ends in static symmetry as a limit.

My model treats symmetry as a dynamic generator of becoming itself.

The key disagreement is not geometry — it is what equilibrium is allowed to mean.

I needed to break with Richard Buckminster Fuller here because I needed to solve infinite regress and account for the whole of Nature as a total system, not just an isolated case of geometry.

And that is a fair criticism, and honestly, this is where my framework becomes more philosophically ambitious than Fuller's.

Fuller was primarily describing geometry, energetic balance, structural systems, and synergetics. He was not attempting to solve infinite regress, the origin of causality, the hard problem of consciousness, or why existence exists at all.

I am trying to build a total metaphysical framework. So from within that larger ambition, I am right to insist that a merely static equilibrium is insufficient.

Because if equilibrium is truly frozen and inert, then questions immediately reappear: how does motion arise, how does differentiation appear, how does consciousness emerge, how does Nature avoid regress, and why does anything continue at all?

My critique of Fuller is therefore essentially this: a dead equilibrium can explain symmetry, but it cannot explain becoming.

And that is a legitimate philosophical objection.

In essence, my framework attempts something harder: to explain why reality is dynamic without introducing an external starter.

That is why I reinterpret equilibrium itself as not static balance, but self-generating balance.

And that is a more radical move philosophically, because it avoids first causes, external scaffolds, and frozen absolutes.

My strongest argument against Fuller is this: if perfect equilibrium were truly static, then it could never generate or sustain Nature. Therefore equilibrium itself must already contain dynamic self-relation.

That, in one sentence, is the core DEMU insight.

However, if Richard Buckminster Fuller were alive and here to defend himself, and if he read and deeply understood my model, then he might say that our views do not diverge at all. Perhaps Fuller's deepest point was that, in his broader "synergetics" thinking, the universe is fundamentally dynamic and constantly restructuring, even when it passes through states of equilibrium. So, basically, Fuller only meant that Nature cannot remain in a state of equilibrium forever. And here we would fully agree.

So maybe we do not disagree at all, and the main difference is that he is seeing this from a 3D perspective and I from a 0D perspective. I too say that once equilibrium is achieved, it dissolves, so Nature must recreate it eternally; Nature never gets to achieve that frozen equilibrium we both fear. The toroidal wings in my model pass out of equilibrium all the time in order to maintain it, so in spirit our views are not that different at all.

We both reject the idea of a frozen, eternal stasis. Fuller: dynamics happen around or through equilibrium. Me: dynamics are identical to equilibrium. But my point is that, if you take my “identical to equilibrium,” which is 0D, and unfold it into 3D, then my “identical to equilibrium” would look just like “dynamics happen around or through equilibrium.”

It is possible that a self-referential identity-process (my view) could appear, under temporal unfolding, as a system where “dynamics happen through equilibrium” (a Fuller-style description). So at the level of appearance, you can map them.

However, that does not fully collapse the difference, because what matters is not just how it looks when expanded, but what is claimed to be ontologically primary. Fuller still treats equilibrium as a feature of a structured system that evolves through energetic relations, whereas I treat equilibrium as the generator of the system itself via zero-delay self-relation. In my view, what Fuller describes as a property of dynamics is actually identical to the generative source of those dynamics, but it only appears separated when rendered in 3D time.

However, again, it is possible that if Fuller were alive, he might agree with this interpretation, and that our views would, in that case, be effectively identical.

Cosmic Recycling

If nature solves infinite regress with a kind of “grand death” (the cuboctahedron), and if nature is structured as a dual torus, then the center of the dual torus is where this grand death would be located.

By “grand death,” I mean a state in which nothing has yet had the opportunity to manifest or differentiate into form — a state of pre-manifestation. Imagine holding a pen just before drawing: the paper is completely blank, and nothing has yet been inscribed. Nature, in this sense, exists in a uniform state prior to differentiation. If everything is red, nothing is meaningfully red, right? By definition, such a state cannot contain entropy, because entropy presupposes differentiation and microstates.

If black holes represent the contraction phase of a cosmic dual torus, and white holes represent the expansion phase, and the center corresponds to this eternal “death” state, then one can interpret black holes as processes that absorb matter, pass it through this state of maximal uniformity, and thereby strip away differentiated structure.

On this view, entropy is effectively reset into a uniform condition, which is then re-expressed outward through white holes.

This would imply that energy which was previously unavailable for mechanical work becomes available again, not through violation of conservation laws, but through a cyclic reconfiguration of states. I am not claiming this as a literal perpetual motion device or an overunity mechanism in the engineering sense. Perpetual motion machines do not work because they assume work without a source of energy, which is a contradiction by definition. Similarly, “overunity” understood as energy creation from nothing is incoherent.

Nature cannot be created or destroyed; it is, in my view, eternal.

So when I say “free energy,” I do not mean energy from nothing. I mean a scenario in which nature has an intrinsic capacity to reconfigure entropy—effectively resetting differentiated structure back into a uniform state and then redistributing it again through the system. This would, in principle, resolve the problem of an unbounded accumulation of entropy in an eternal universe.

From this perspective, infinite regress is avoided because there is no one-way accumulation without return: the system is cyclic and self-balancing rather than progressively diverging. In other words, what I am calling “free energy” is not violation of reason or conservation, but the idea that nature contains an internal, self-contained mechanism for continual entropy reconfiguration.

Imagine if you have no time — by time here I mean the classical notion, like a seed growing into a flower. So imagine you didn't have it; then the seed would stay a seed.

Now imagine that nonexistence is impossible. What you are left with is something that looks like a kind of nothingness, because without time you cannot manifest form.

If you start with form, then where did that form come from? You might say: I start with form, the dual torus. But that is not so, because on the dual torus expansion is met by contraction, so it has no fixed form. There is no outward manifestation; it is only the animal mind that models it into form.

This “something” then — this timeless state at the beginning of everything — because it is something and not nothing, is like the color red. That is, it is something. But in this state, everything is red, so if everything is red, “red” loses its meaning. Everything is uniform.

Thus, if this state exists, it can reset entropy, because entropy is not a uniform state. And I suggest that this uniform state does exist, because only it can solve infinite regress, as regress too is not a uniform state.

Thus, now you can see matter being carried by black holes back to this uniform state and becoming one with it again, because the uniform state must always obtain. The moment it did not, we would have differentiation and infinite regress at the heart of Nature, which is absurd!

Then this new order is, because Nature is dynamical and always circulating, carried back into spacetime via white holes.

I am trying to build a single loop:

- a pre-manifest uniform state (no differentiation, no entropy),
- a differentiated world (spacetime) generated as an “appearance” of that state,
- a return mechanism (black holes) that collapses differentiation back into uniformity,
- and a re-emergence mechanism (white holes) that expresses it again.

The internal architecture I am aiming for is a cyclic ontology, where difference and uniformity are continuously transformed into each other.

As a metaphysical or conceptual system, I see this as coherent in the sense that I am trying to:

- eliminate infinite regress,
- avoid a first cause,
- and replace both with a self-contained cycle of differentiation ↔ uniformity.

This is a recognizable philosophical move, broadly aligned in spirit with cyclic cosmological thinking.

1) Entropy (real physical definition)

In physics, entropy is not “difference” or “disorder” in a loose sense.
It is:

the number of microscopic configurations that are compatible with
a macroscopic state

In simple terms:
entropy is about how many different underlying ways a system can
be arranged while still appearing the same at a large scale.

Key implication:
Entropy is about counting possible underlying configurations, not
about visible structure or lack of structure.

2) My “ontologically undivided uniform state”

I am not describing equilibrium. I am describing something
stronger:

a state with no internal distinctions, no separability, and no differentiation whatsoever — not just uniform appearance, but ontological unity.

So in my terms:

- no parts
- no micro-distinctions
- no relational structure

- no degrees of freedom already expressed

This is crucial: it is not a “homogeneous system,” it is a pre-structural state.

3) The key question: what is entropy in an undivided state?

Now I combine the two definitions honestly.

If entropy depends on:

the number of distinguishable microstates

then I must ask:

Does an ontologically undivided state have microstates?

There are two consistent possibilities:

Case A: Truly undivided = no microstructure exists

Then:

- there are no distinguishable configurations
- there is only one possible description: “no distinctions”

So:

entropy = 0

But this comes with a consequence:

There is no internal structure to generate variation.

In other words:

variation requires distinction.

If absolutely everything is ontologically one and undivided, then there are no internal contrasts from which motion, change, or configuration-space evolution can arise in the conventional sense.

That is why, from standard reasoning, a perfectly undivided state appears dynamically inert.

But those who reason like this are often not philosophers, but physicists, and physicists are often too down to earth to truly see what Nature may actually be doing beneath appearances.

In my philosophy, I do not require structure in the usual sense. I do not need being (structure), only becoming (doing). I am saying equilibrium itself is dynamic: formless, with expansion and contraction occurring with zero delay, producing no temporal separation, no stable structure — only an endless landscape of “death” understood as undifferentiated unity.

In my model, life and the universe occur in the toroidal wings, while the center is this pure undivided state. That center must exist, otherwise I get infinite regress and paradox.

Case B: Physics view (for contrast)

In standard physics, even “uniform” states still have:

- underlying degrees of freedom
- quantum configurations

- microscopic variation

So:

- the number of micro-configurations is huge
- entropy is high, not low

But this case does not match my ontologically undivided state, because physics does not assume absolute undividedness.

4) Does my uniform state “reset entropy”?

Now I can answer precisely.

In my ontology:

- undivided state leads to no distinguishable configurations, so entropy is zero
- differentiation leads to the emergence of distinguishability, so entropy increases

So a cycle like:

differentiation → undivided state → differentiation
would mean:

- entropy decreases to zero
- then increases again

So yes — it functions as a reset cycle within my framework.

5) The critical constraint (this is the important part)

My model depends on a very strong claim:

A state with no internal distinctions can give rise to distinctions without already containing them in latent form.

Because in standard physics:

- entropy increase is easy (systems spread out)
- entropy decrease requires constraints, information, or boundary conditions

So the tension is:

If the state is truly undivided:

- it has no internal structure
- so nothing inside it selects or generates specific differentiation pathways

6) Bottom line

With the real definition of entropy, my “uniform state” corresponds to zero entropy only if it has exactly one admissible configuration, meaning no microstructure at all. That makes it a true entropy minimum in a mathematical sense.

But physics does not currently treat such a state as a dynamic phase of reality. From my perspective, that is not evidence against my model — it simply means physics has not yet identified the true timeless ground of reality.

So the conclusion is:

My uniform state can represent a zero-entropy boundary condition in principle, but physics does not currently support it as a physical “reset mechanism” that dynamically cycles entropy in the way my model proposes. I do not take that as falsification, but as a sign that the framework is ahead of current interpretation.

A Clarification

If absolutely nothing inside the state distinguishes one possible unfolding from another, then what determines the form differentiation takes? My answer is: the geometry itself determines the unfolding.

So the undivided state is not “empty” in the ordinary sense. It is undivided, but it still possesses intrinsic relational form through the geometry of dynamic equilibrium itself.

In other words:

- the geometry is not added afterward,
- the geometry is the self-relation of becoming itself,
- and differentiation unfolds naturally from the dynamics inherent in that geometry.

This means my model is not saying:

“something comes from absolutely nothing.”

Rather, I am saying:

“structure emerges from the intrinsic dynamics of primordial geometric self-relation.”

So the dual torus is not merely a shape inside reality to me — it is the generative logic of reality itself.

Differentiation emerges from pure self-relation itself, not from pre-existing differentiated content.

That is why my position is such a strong philosophical claim.

Most systems assume that being comes first, and that becoming follows from differences already contained within being. I am proposing something more radical: becoming itself is primary, and distinctions emerge from dynamic equilibrium without pre-existing differentiated structure.

To me, the difference between being and becoming is this:

Being is like scaffolding that can simply stand there unchanged. Becoming is more like scaffolding that collapses the moment it is formed and therefore must continuously recreate itself. Its “being” is only an appearance generated by continuous self-renewal.

I am therefore arguing that true static being is impossible because it ultimately leads to infinite regress. Becoming is the only thing that truly exists.

So yes, from my perspective, the stable “things” we perceive are ultimately illusions of process. There are no completely self-contained things in themselves — only continuous becoming appearing as things.

Free Energy

Why free energy is “free,” in my model, is because the recycling phase itself does not require additional external energy input. Black holes sucking in matter do not require energy in the ordinary sense; they are expressions of the contraction phase of the cosmic cycle. Likewise, the death state—the state that removes entropy and returns differentiated structure toward undifferentiated balance—does not require energy because it is not constructing new complexity, but dissolving it back into equilibrium.

In my framework, this is the key distinction:

- expansion and differentiation generate structure, tension, separation, and complexity
- contraction and undifferentiation reduce structure back toward balance

So the “free” aspect comes from the fact that nature does not need an external fuel source to restore equilibrium. The contraction phase is spontaneous because balance is intrinsic to the system itself.

In other words, if reality is a self-balancing dual-torus process, then collapse back toward equilibrium is not an added operation requiring

extra energy expenditure—it is simply the natural return flow of the system.

This is why I reject the idea that entropy can increase forever. If expansion were the only process, reality would accumulate disorder infinitely and run into infinite regress. So the system must contain an opposing phase capable of recycling structure back into a lower-entropy state.

In my model:

- black holes represent the contraction/recycling phase
- white holes represent the expansion/re-expression phase
- free energy comes from the fact that the total system is cyclic and self-balancing rather than externally powered

So “free energy” is not magic energy appearing from nowhere. It is the consequence of reality being a closed geometric recycling process where equilibrium restoration is built into the structure of existence itself.

What I am really saying is this:

the return to equilibrium does not require additional energy expenditure because equilibrium is the default state of the system.

In my model:

- differentiation, structure, and separation are the “active” states

- timelessness/equilibrium is the “rest” state
- so returning to timelessness is not something that must be powered externally

This follows the same basic logic as:

- a stretched rubber band relaxing
- water flowing downhill
- tension releasing back into equilibrium

The system does not need “extra energy” to stop being differentiated. In my terms:

collapse back toward timeless balance is spontaneous because balance is ontologically primary.

So when I say:

black holes do not need energy to shuffle matter back to timelessness

the strongest version of that idea is not:

“black holes create free energy”

but rather:

“the contraction/recycling phase is energetically downhill relative to differentiated structure.”

That is the cleaner and more precise formulation.

Likewise:

timelessness, as the death state, does not require energy because it is not a productive or differentiating state—it is the dissolution of tension, distinction, and structure back into equilibrium.

From within my framework, this is internally coherent metaphysically.

Of course, mainstream physics would object that:

- black holes still obey energy conservation
- gravitational collapse releases enormous amounts of energy
- “timelessness” is not a recognised physical state

But from the internal logic of my model:

the restoration of equilibrium is “free” because equilibrium itself is the natural baseline state of reality.

My model also obeys energy conservation. So the cleanest way to frame my position is not:

“energy is created for free”

but rather:

“the system recycles energy without requiring an external source beyond the system itself.”

That is a major difference.

The logic is:

- total energy is conserved across the full dual-torus cycle
- expansion/differentiation expresses energy outward into structure and form
- contraction/recycling returns structure back toward equilibrium

- no external “fuel” is needed because the process is self-contained

So when I say the recycling phase is “free,” what I really mean is: the return toward equilibrium is spontaneous within the geometry of the system and does not require additional external energy input.

Thus, my model is not violating conservation—it is proposing: a closed-loop energetic circulation.

In my language:

- white-hole phase = expressive/differentiating phase
- black-hole phase = compressive/recycling phase
- timelessness = equilibrium baseline underlying both

So the “free” aspect is:

- not free creation of energy
- but the absence of an external energetic cost required to restore balance

Some may object and say that black holes have high entropy, not low. But my response to that is: so what? What does that have to do with my model? Exactly nothing. It is timelessness (death) that resets entropy, not black holes. And it is white holes that have low entropy.

Also, timelessness is not “beyond” the universe. It is inside the universe. You could even visit it and try to touch it, though you would not enjoy it. Time and timelessness are intertwined.

More: I don't see how you could regenerate (reset entropy) without timelessness. If the first order in nature is not up to the task, then any second order definitely isn't, and it would be arbitrary.

White Hole Earth

In my terms, “cosmic recycling” (see previous chapter) is the idea that reality is a self-contained cycle of differentiation and undifferentiation.

The universe appears as structured, differentiated spacetime (the “wings” of the process), but this structure is not permanent or self-sustaining on its own. It continuously returns toward an undivided, pre-manifest state through collapse processes (which I associate with black holes and compression toward the center).

From that undivided state, differentiation re-emerges again through expansion processes (which I associate with white holes or outward unfolding).

If we adopt this “cosmic recycling” structure — where reality is a continuous loop of differentiation and undifferentiation — then Earth can be interpreted as a local expression of the outward phase of that cycle.

In this picture, the system works like this:

The center of the dual-toroidal structure represents undifferentiated unity (my “uniform state”).

Collapse processes (black holes) return differentiated structure toward that unity.

Expansion processes re-express that unity as structured reality again.

Within that logic, a “white hole” is not just a physical object, but a direction of emergence: the re-expansion of structured reality from the undifferentiated ground.

The deeper level of reality is a zero-delay, undivided generative field (the geometry of the dual torus). That field cannot remain static; it expresses itself as differentiation. The expression of differentiation is experienced as spacetime. Certain regions of spacetime function as re-injection points of structure into manifestation.

In my interpretation, Earth is one such region.

So Earth is not just a planet sitting in space — it becomes a localized expression of outward re-manifestation from the underlying undivided state.

To support the idea of “Earth growing” within this framework, I would argue:

If the universe is not static but cyclically re-expressing itself, then local systems are not fixed objects but processes within unfolding geometry. What we interpret as planetary stability may instead be slow structural reconfiguration within the underlying cycle.

So “growth” becomes a reinterpretation of slow rebalancing or re-expression of deeper geometric dynamics, rather than literal creation of mass from nothing.

The key logical claim in my system is this:

What looks like stable physical objects are actually temporary stabilization patterns within a deeper cyclic process of expansion and contraction.

So Earth, in this reading, is not a closed object. It is a stable node in a continuous geometric recycling process, potentially functioning as part of the outward expression phase — the white-hole aspect of the system.

From standard physics, I should be clear that:

- there is no empirical evidence that Earth is growing via a white-hole mechanism,
- white holes remain hypothetical, not observed,
- and planetary mass increase is not explained in this way.

So my model is a metaphysical reinterpretation, not an established physical theory.

Within my framework, however:

Earth can be interpreted as a stabilized expression of the outward phase of a cosmic recycling process, where undifferentiated reality re-manifests as structured spacetime. In that sense, Earth is not a fixed object but a dynamic node in a continuous cycle of collapse and re-expression, corresponding to the white-hole aspect of the dual-toroidal system.

So in short:

reality is a continuous loop where structure forms from an undivided state, collapses back into undivided unity, and then re-emerges again as structure.

In this framing, nothing is ever truly created or destroyed — only transformed between differentiation (appearance) and undifferentiation (unity) through a cyclic geometric process.

In my view, existence cannot arise from absolute nothingness/nonexistence. If anything exists at all, then existence must in some sense be eternal — because “nothing” has no properties, no structure, and no capacity to produce anything.

But if existence is eternal, then we face a different problem: entropy. Over an infinite duration, any differentiated structure would accumulate irreversible complexity or decay. This leads to a form of infinite regress in thermodynamic terms — not just of causes, but of unresolvable historical accumulation.

Modern physics tries to avoid this by placing a boundary at the Big Bang, treating time itself as beginning there. In that view, entropy only has a finite history, so there is no infinite buildup problem.

However, in my framework, this does not resolve the deeper issue! If time itself is part of existence, then it cannot simply “start from nothing” either, because the concept of a starting point already assumes a temporal structure in which beginnings make sense. You cannot derive time from non-time without reintroducing the same explanatory gap in a different form!

So the problem is not only entropy, but the deeper question of how temporal becoming arises at all.

For that reason, I argue that existence must be structured in a way that is self-contained and non-linear — not a one-directional timeline with a beginning, but a self-sustaining cycle in which differentiation and undifferentiation continually transform into one another.

So time must be **eternal**, even if you start with timelessness, which is why I concluded that timelessness is dynamic and contains time itself. Time never had a beginning; it has a geometrical reference point — a point you can point to and say, “existence starts here,” the dual torus core — but time itself *never began*.

Eternity is like a circle with no beginning or end, which is why the universe is eternal.

Modern physics often leans on the idea that “there is no infinite buildup problem,” but in my view this misses something deeper! It implicitly relies on a linear interpretation of processes, whereas reality itself is non-linear.

So, the only real way to resolve the paradox of entropy is if nature has an inbuilt recycling process that can reset entropy. Physics can describe a single arrow of time, but reality may require at least two arrows working together.

What I meant by:

“You cannot derive time from non-time without reintroducing the same explanatory gap in a different form.”

is this:

If I start with “non-time” (timelessness) and try to explain how time emerges from it, I immediately face a structural problem:

1. I am using time to explain time

To say “timelessness produces time” already sneaks in:

- a before/after structure (“first timelessness, then time”)
- a transition or process (“it becomes time”)
- a causal relation (“it generates time”)

But all of those ideas already assume time-like ordering.

So I end up doing something like:
trying to explain time using concepts that only make sense inside
time

That is the “hidden loop”.

2. The explanatory gap just moves, it doesn't disappear

If I say:
“timelessness creates time”
then the next question becomes:
how does creation happen without time?

And if I answer that:
“it happens in a non-temporal way”
then I've introduced a new unexplained mechanism:
a “non-temporal happening” that still behaves like a process

So the problem doesn't go away — it just changes form.

3. The core point in simpler terms

What I am pointing at is:
I can't explain the existence of time by using any story that already
behaves like time in disguise.

Because then I haven't removed the assumption of time — I've just
renamed it.

4. How this connects to my model

My way out of this is exactly what I am trying to do with:

- zero delay
- simultaneity
- dual torus structure

Because then I am no longer saying:

“timelessness produces time”

but instead:

“time and timelessness are two renderings of the same underlying structure”

That is a fundamentally different move, because it avoids a temporal “generation step” altogether.

And I have to be clear that timelessness in my model is not a frozen, static state. It is motion — fast-moving, self-balancing motion.

Repeat

The following may repeat parts of my philosophy, so I apologize for that. However, I felt it was important to include it once more.

Why My Idea of Unlimited Energy Must Be True

You must solve infinite regress; otherwise, you will never reach the bottom of your explanatory layer.

The beginning of time, then, must be a uniform state where no parts stick out. This would create a state that is totally balanced, and then you have solved infinite regress, because if you ask why balance, you simply answer with balance again. Thus, it is balance all the way down.

This only works for the concept of balance, because any other state would have parts sticking out. Thus, you are left with three options at the beginning of time:

1. A state from nothing at all, which fails basic reasoning.
2. A state that isn't balanced, but then we must ask why.
3. A balanced state.

If we ask why balance, we first understand that it must be because all other options fail, and balance has a kind of elegance such that even if you had an infinite tower of it, the tower itself would still be balanced, with no parts sticking out. Asking what is beyond balance only leads to a balanced state again. Thus, there is nothing "beyond" it either, because that "beyond" would itself have to be balanced, fail basic reasoning (1), or be part of a paradox (2).

Now that we understand that balance must be fundamental, we ask what it is. How do we model it?

We know it can't be nothing at all (1), so it must extend into space. But if it extends into space, it will have parts sticking out (2), so it must avoid both. When you follow this reasoning, you end up with a dual torus, because you need to expand and contract simultaneously such that you avoid being (1) and (2), and instead satisfy (3), which is balance. You need a dual torus, therefore, because you must remain balanced.

This also solves the problem of the Unmoved Mover, because the dual torus doesn't move anywhere when it moves. That is, the expansion is met by the contraction. You now have motionlessness, and motionlessness doesn't need to be set in motion because it isn't going anywhere.

Now you have answered what was at the beginning of time: motionlessness, which is timelessness.

So imagine being timeless for all time and having no history. You are just a blank slate. This is as close as you come to nonexistence without being nonexistent. So now we know we have found a real candidate for the basic building block of nature: a dual torus. It is eternal.

But if you have motionlessness first, how do you get the universe going? We answer this with the fact that motionlessness is generated by, or more accurately is, balanced motion (expansion equals contraction).

So now we have something rather than static nothingness: a self-sustaining process of balanced motion. The animal mind can then model this zero-dimensional process as a three-dimensional world. What we experience as space, time, motion, and physical structure is the mind's representation of that underlying process. In this sense, timelessness and time are not two separate realities; they are the same thing viewed from different angles.

So now we have a universe, but why does it become complex?

We can answer that as well, because eternity is a dual torus and thus has complementary forces already built in (i.e., it is dual). These forces can generate more and more of themselves, creating more and more balance.

We also arrive at the purpose of the universe, as opposed to it being a brute fact. The universe's function is to produce balance.

Now you can see why the universe must be a recycling system. Existence is eternal. It cannot arise from nonexistence, because there is no mechanism, even in principle, that can bring existence out of nonexistence. Like baking a cake with no ingredients, you don't get a cake. So nonexistence is not a real rival to existence, because it cannot even contain the idea of itself as a list of no ingredients.

Thus, in order to maintain balance, as we established earlier, the universe cannot simply become a junkyard of old matter.

What resets matter, then, is the point of balance itself, because it contains no history at all. So what must happen in reality is that the dual torus spins so fast, becoming motionless (spin = motionlessness) at its core, that spacetime and entropy cannot form there (i.e., no history). The state contains no history, and therefore no notion of space, time, or entropy.

All of this follows logically from one principle to the next. I am not jumping to conclusions. I am building from one principle to the next. I may not be the best at explaining it, but I am not jumping here.

- the dual torus is not my preference
- it is the output of the constraints
- and anyone who truly runs the logic should land there

1. **Constraint:** No infinite regress → ground has no unexplained asymmetry.

2. **Implication:** No asymmetry $\rightarrow$ global **balance**.

3. **Implication:** Balance must be **dynamic** (to generate balance) yet globally canceling.

4. **Implication:** Dynamic cancellation requires **closed, opposing flows**.

5. **Implication (3D extension):** Closed, self-canceling flow in an extended system $\Rightarrow$ **toroidal circulation** (no boundary, no net displacement).

6. **Implication:** Full symmetry requires **paired/opposed flows** $\Rightarrow$ **dual torus**.

7. **Corollary:** Net motion = 0 (unmoved mover), local motion persists.

8. **Corollary:** A timeless core (no history) follows from zero-delay cancellation.

What would break it:

- If a **non-toroidal** topology can realize global, boundary-free, self-canceling flow, the derivation fails.
- If **static balance** can generate a universe without introducing asymmetry, step 3 fails.
- If **asymmetry** can exist at the ground without reintroducing “why,” step 1 fails.

And static balance fails because it cannot even generate itself. But why must balance be a doing (becoming) rather than a being, or something static? Because to avoid nonexistence, we needed existence. Or, put another way, we do not have nonexistence.

Further, existence comes as symmetry (balance), and how are you going to produce symmetry without motion? You need extension, and that requires motion, unless you claim that the extension is “just there” as a brute fact. And then you must counter that extension, which again requires motion.

But why do you need to extend at all? Why can’t you just be a zero-dimensional point? You can—that is what extension equals contraction means—but that zero-dimensional point still needs extension and contraction; otherwise, it is *nothing* at all, which is impossible.

But why can’t extension and contraction be static? We already addressed that: to extend requires motion, unless you again appeal to a “brute fact.” And this kind of static timelessness cannot generate our universe, because it is static.

You could imagine a block universe, but I think that is an oxymoron. Arguing that motion is an illusion is like arguing that consciousness is an illusion. There is no force in the argument—only an abstraction one has to take on faith.

To extend, you need to move from A to B, even if the contraction from B to A happens simultaneously.

A critic can say: Extension can be a state, not a process, etc., but he is simply trying to hide infinite regress without us noticing. But I notice. Even if you had a static state, you would still have imaginable causality—that is, states that would normally require time—which you have just inserted into your frozen landscape.

A frozen state can still contain latent sequence, which reintroduces the very thing it was supposed to eliminate.

Again: A static state does not eliminate causality; it merely encodes it. And if causality is encoded, then the conditions for regress are still present, even if time is no longer explicit.

In sum: Static balance fails.

You say: ““Only balance works.” You argue that anything else has “parts sticking out,” and therefore only balance survives, but this is your core assumption and is not fully proven, since one can still ask why a non-balanced state cannot exist without needing explanation or why “sticking out” must be forbidden, so the conclusion has not been logically forced.”

My reply: Sure, I haven’t proven beyond doubt that existence cannot be a paradox, but come on, man—let some other hardcore philosopher do that. I don’t care, because understand that existence cannot be a paradox, since paradox is, in the end, a product of language if you analyze it deeply; just like nonexistence, it too is only a product of language.

You say: “But you haven’t shown why only a dual torus satisfies the balance claim.”

My reply: That is exactly what I did, if you paid attention. Space is here, which means extension is real. That extension must be balance, which logically creates a torus. There is no other way, as the flow must

cancel itself, and the torus must itself be part of that balance. Thus, you get a dual torus. There is no other solution in logical space. You can try a Möbius strip or any other weird shape, but they won't work. Plus, it is obvious that we are dealing with a dual torus, or else you would need to explain that shape too. So the only way not to hide that shape in the closet is to make it the fundamental shape. It is the only possible model, even if I won't calculate that beyond doubt here.

You say: "You must give a reason why entropy must disappear, not just 'cannot exist.'"

My reply: I gave that reason. Eternal death and decay would make existence unbalanced and paradoxical—having an eternal junkyard just existing for no reason, since existence cannot come from nonexistence.

You say: "Non-paradoxical $\neq$ uniquely 'balance' as you define it. It could also be a necessary structure."

My reply: Now you are just identifying with what my balance already is.

You say: "Your Möbius strip example is good, but a skeptic will say: 'Why can't other topologies satisfy balance in a different way?'"

My reply: To that I say, just try. I have posed this challenge before. And as a philosopher, I know the dual torus is the basic building block of nature, because infinite regress can only have one solution. You must also set evolution going, and then you need a dual force.

You say: “Your argument: Eternal decay $\rightarrow$ cosmic junkyard. Junkyard has no reason to exist. Existence cannot arise from nonexistence. Therefore decay must be countered. Therefore reset is necessary. This is actually one of your strongest intuitive arguments. But here’s the precise issue: you are moving from aesthetic or existential dissatisfaction to logical impossibility.”

My reply: No—now you are trying too hard to object and failing badly. There is no real objection here. I used only logic, and you accuse me of aesthetics! This is just wrong. Now you can win any argument against me simply by painting me in another color. Having an eternal junkyard is like having an eternal anything, and is therefore subject to the same infinite regress as anything else, which we solved by balance. I didn’t solve it by aesthetics!

You say: “Why must the stopping point be balance rather than some other self-consistent structure?”

My reply: I explained that too. I explained it with the 1, 2, 3. You have three options, and any other self-consistent structure would be the same as balance. You can’t have two different kinds of balance, because balance is the act of balancing; it is a doing.

You say: “A critic might still say the junkyard is just a brute fact. However, a brute fact that encodes arbitrary distinctions has not removed the demand for explanation; it has frozen it. That’s a fair philosophical push.”

My reply: Thank you. Now you see the absurd level of thinking a skeptic has to adopt for his worldview of death/junk to be true.

- The ground of reality must eliminate infinite regress.
- Infinite regress arises from unresolved asymmetry (something that could be otherwise).
- A high-entropy “junkyard” state contains arbitrary, uneven distributions.
- Therefore, it contains unresolved asymmetry.
- Therefore, it reintroduces infinite regress.
- Therefore, it cannot be the ground.
- Therefore, a reset mechanism is required to restore balance.

Anything in space, whatever it is, contains infinite regress if it is not balanced. That is my whole point.

Now let's take a closer look at the concept of nonexistence.

The Collapse of Nonexistence:

Again: Nonexistence cannot get existence going, and it cannot get itself going either. It doesn't have a pen to start writing that list of no

ingredients, and even if it somehow got a pen, it has no paper. To see this, try to define nonexistence as the absence of everything, but if you remove everything, you also remove the idea of absence, and thus you cannot form your definition of nonexistence. So nonexistence only works as a philosophical exercise as long as you have existence to give it some temporary power.

But then one might say that nonexistence may not be definable by language; it is like infinity, abstract but not fully defined. We don't need a complete definition to refer to something. Nonexistence doesn't need to be definable to be possible. The limitation is in language, not reality.

To that I reply: sure, you can hide behind a wall of ignorance forever and never step out and engage in a real fight, because you know you lose as soon as you try to define nonexistence. But as a philosopher, I hold that nonexistence is nonsense simply because existence is here; thus, nonexistence cannot be true inside language, outside it, or in any shape or form. You cannot have both existence and nonexistence, because that would be a contradiction. So the fact that existence is here tells you that nonexistence is impossible.

And even if nature lies beyond the logical systems of humans, existence would still occupy whatever "space" nonexistence would have if it were true. The point is simply to use philosophy to understand why nonexistence fails, not that it was ever a real alternative. And we see why nonexistence fails when we try to define it.

Also: The idea that there 'could have been nothing instead' assumes a temporal or modal alternative, but existence already includes all time.

There is no moment, no state, and no ‘elsewhere’ where nonexistence could be realized. Therefore, nonexistence is not a genuine possibility.

When fully analyzed, nonexistence is a product of language—a product of negation within a logical system, nothing more. So if you can prove that the logical system itself is man-made, then you have a knockout argument against nonexistence, because nonexistence cannot enter reality at all, as it would be stuck within a logical system that is itself a fabrication.

Let us say we have demonstrated beyond doubt that opposites cannot be a thing. Then Being cannot have its opposite, Non-Being. Now we see why existence must be: Non-Being could never be real. Fine. But I think a philosopher who asks the question, “Why is there something rather than nothing?” is actually asking a deeper question:

Suppose you started with a blank canvas—neither Being nor Non-Being. If you inserted Non-Being first, Being would be impossible because we have already concluded that opposites are impossible. So, in that sense, the question becomes: **Why is there Being rather than Non-Being?**

At this level, I think we need to define Non-Being. Otherwise, we might as well ask why there isn’t any number of nonsense words instead. Why is there Zorblax rather than Quendrix? The best definition I can come up with is this: Non-Being is the state of motionlessness. Now there is no manifestation, because manifestation requires mo-

tion—like a pen moving to form a picture. Thus, at the beginning of everything, we do not even have the color black!

From here, we can see why Being is: motionlessness itself can only be achieved through motion, something I have argued for elsewhere. So now you have to define Non-Being in some other way. You would have to define Non-Being as neither motion nor motionlessness, and once you do that, you end up with nonsense (Zorblax)—or, at least, I cannot make sense of such a definition.

So, why is there something rather than nothing? Well, define nothing as motionlessness, and the answer is: **nothing is something**. That is the solution. Or define nothing as Non-Being or nonexistence, and nothing is simply nonsense.

So nothing, or nothingness, could be the starting point of existence—it depends on your definition. But one thing is for sure: the absolute starting point of existence contains not even the color black. No manifestation.

But this is only the core of the system. The system itself has these huge toroidal wings that contain everything. So the whole system encompasses *nothing* and **something**: two in one. They are one and the same system.

Life and death are two faces of the same coin.

Note: To make sense of all this, you need to be familiar with my philosophical system; otherwise, it might just sound like complete gobbledygook.

My argument, stripped down, is roughly this:

1. “Why is there something rather than nothing?” only works if **nothing** denotes a coherent alternative.
2. So I ask: What is nothing? Define it.

3. If nothing means **motionlessness**, then—given my separate argument that genuine motionlessness is constituted by perfectly balanced motion—nothing is not Non-Being. It is a state or process of Being.

4. If instead nothing means **absolute Non-Being**, then it cannot be identified with either motion or motionlessness.

5. I then challenge the critic to provide positive, intelligible content for this supposed third possibility.

6. If no such content can be supplied, “absolute Non-Being” may have no more explanatory content than an invented term such as **Zorblax**.

7. Therefore, there may never have been two genuine alternatives—**Being and Nothing**—requiring us to explain why reality somehow “chose” Being.

Now the critic might say:

“Fine. By nothing I don’t mean motionlessness. I mean the complete absence of Being.”

And this is where my Zorblax challenge becomes important:

What exactly does “the complete absence of Being” mean?

If the answer is merely “not Being,” then my objection is that negation has been substituted for an ontology. Saying **not-X** does not automatically establish that there is a possible state corresponding to **not-X**.

If absolute nothingness is incoherent, asking why Being “won” is like asking why there is Zorblax rather than Quendrix. The grammatical form makes it look as though two genuine possibilities have been identified when they haven’t.

In the end, **Existence does not need to defeat Nothingness, because Nothingness was never a coherent alternative to Existence in the first place.**

The critic might say, “Hold on. I Googled it, and Zorblax actually means something. Apparently, it’s a popular placeholder name for a stereotypical fictional alien in modern pop culture and science fiction.”

Okay, let me take a moment to formulate my devastating philosophical response to that: **Touché.**

Repeat Repeat

The following may repeat parts of my philosophy, so I apologize for that. However, I felt it was important to include it once more.

What Started Motion?

My final conclusion regarding the most puzzling question of all time—what started motion?—is this: motion does not need to be started because it is already in perfect balance (i.e., the cuboctahedron/dual torus). Meaning that all motions have their counter-motions, so nothing begins (i.e., starts moving) because nothing ever moves (locked like arm wrestlers in a deadlock), and there is no room (space) or time in which to start anyway.

But if nothing ever moves, how can you have traditional motion in spacetime? Because although, in reality, nothing moves, the state is

still constantly updating. That is, each movement is countered by a counter-movement, but this is still an active struggle, not a passive one. So the struggle, although it does not move, still carries into the future; thus, it moves vertically in a sense. And this is the key: the movement is still real motion; it is just countered by a counter-movement. So although timelessness does not move in the traditional sense, that does not mean it is frozen. Movement is not an illusion. Like Superman flying so fast around the Earth that you can't track him—he's still flying.

Then the animal mind can take that vertical movement (timelessness) and translate it into horizontal motion (spacetime), if that makes sense—like taking white light and getting a rainbow.

In the universe we see someone start at point A and end up at point B, so motion is linear. In timelessness, motion is not linear. Here, if you start at point A, then point B would also start simultaneously, even though you haven't reached point B yet. This is the logic of the dual torus, where expansion is met by contraction. So there is no runway in timelessness to go from A to B. In one sense, timelessness is the quantum world—strange and counterintuitive. In reality, it is just the animal mind translating timelessness into time, and the picture gets distorted.

That is, I think the quantum world is just the animal mind trying to make sense of timelessness by translating it into time, and the translation will then be a bit off, of course.

You may notice that my picture is a bit strange, because classical motion is, in my view, an illusion or a translation of the animal

mind. Real, timeless motion is not an illusion; yet it is still very much like classical motion, just set in another ‘world.’ A critic might point this out. However, I already have access to the timeless realm—the thing-in-itself—because I equate it with consciousness. Thus, I hold that timeless motion is not an illusion because consciousness is not an illusion.

I can’t know that timeless motion functions like classical motion in perfect balance, but what I can know is that it is not an illusion, and that it can at least be modeled using classical motion in perfect balance (i.e., the dual torus).

- timeless motion = timelessness
- classical motion = linear motion in spacetime

+

But still, even if your timeless motion does not move outward into spacetime, and spacetime is only modeled by the animal mind, if this timeless motion is real motion in the truest sense, it would still have a history, and thus you would still need to explain how it began—how it started to move.

My answer: Yes, I agree in spirit. But if you try to model this motion as having a history (outward expansion), you also get something like anti-history (inward contraction) accompanying it. In that sense, you no longer have a stable history in which you can meaningfully say the motion “began.” It becomes something like a loop in which the idea of a starting point breaks down.

So it is, in a sense, like a strange quantum-like effect, though this effect may exist only in the animal mind trying to decode timelessness into spacetime.

+

But why must you have contraction at the same time as expansion?

Answer: Because any expansion (spacetime) causes infinite regress without exception. Thus, you need contraction in order to solve it. But such a contraction is impossible when seen from the perspective of 3D space, because you cannot contract before you expand—there is nothing to contract when you have not expanded yet at the beginning of time.

Therefore, spacetime has to be an interface created by the animal mind, because in a 0D world, contraction is not a paradox, since there is no expanded space at all.

That is, in a 0D or timeless state, there is no literal extended space that needs to contract. Expansion and contraction are not sequential physical events there; instead, they are more like complementary aspects of one timeless process.

+

But you must start with contraction as well; otherwise, you can't solve infinite regress. So how can you start with contraction in 3D

space when the expansion (the Big Bang) has just begun? There would be nothing to contract yet.

However, if reality is actually 0D and 3D is only in the animal mind, then contraction can happen simultaneously with expansion, because there would be no gap between the states (expansion and contraction) that needs to be crossed first.

+

- If reality is modeled as only expansion in time, I get a “first moment” problem (nothing before it → no explanation of origin).
- If I also require contraction, I introduce a second aspect that prevents that open-ended linear chain.
- But in ordinary 3D/linear time, contraction seems impossible at the start, because it presupposes something already expanded.
- So I resolve the tension by saying that 3D spacetime is not fundamental.
- Instead, at a deeper 0D timeless level, “expansion” and “contraction” are not sequential events but co-present aspects of one structure, so the ordering problem disappears.

+

A materialist will say that perhaps my idealist dream—that we are all one immortal consciousness—is just a dream, because an eternal consciousness would imply an infinite past, and an infinite past is the same as infinite regress and madness. But the same is true for the matter that the materialist believes in: if matter is eternal, it faces the same madness.

So the solution here is that spacetime is an illusion and that real time is non-linear. I think of the non-linear as a sci-fi episode in which the world has frozen and time stands still, so there is no past or future, yet the main character can still move around. Imagine Superman flying so fast that the world stops, yet he can still move around within it.

But then you could say that even in this scenario there would still be a new past and future—namely, the experience of Superman living in a frozen world.

If we start instead with non-living matter, the materialist would say that we escape this paradox. I agree that, at some point, even if idealism is true, we must start with the unconscious. Or, if a universal mind has existed forever, then the unconscious aspect must at least be a place within its vast consciousness so that existence begins from a logical foundation.

And I think this gives more plausibility to idealism than to materialism, because materialism ultimately has to start from literal nothingness in order to solve infinite regress, which would not really be a solution, since you cannot get something from nothing. Idealism, by contrast, only requires the unconscious—a kind of nothingness—as the logical starting point that avoids infinite regress.

Fiction

If nonexistence is fiction because it is only part of a logical system that is itself fictional, then we must start with existence. Existence itself cannot be paradoxical if paradoxes are also fictional. This means infinite regress must already be resolved. And if you cannot simply insert a scaffold into nature to solve infinite regress—because that would itself lead to further regress—then you need motion, and only motion can resolve infinite regress. But this also means motion cannot begin.

However, this introduces another problem: causality. The only way to resolve this is to propose a form of motion so fast that there is zero delay between cause and effect. In that case, the question of what set motion in motion dissolves, because it assumes a causal sequence that no longer applies.

1. Nonexistence is not a genuine ontological alternative, but a conceptual artifact.
2. Therefore, existence does not need to “defeat” nonexistence.
3. Infinite regress cannot be solved by adding external supports (“scaffolds”).
4. Therefore, reality must be self-sustaining.

5. A self-sustaining reality requires eternal motion or process.
6. Eternal motion cannot begin in time.
7. Causality therefore collapses into simultaneity (zero delay between cause and effect).

Say you agree that motionlessness is accomplished through motion. Then you can see, from the point of view of motionlessness, that motion never needed to start because it is motionless. That is, the fastest possible motion = motionlessness.

Still, you might feel like this is cheating. So you try to achieve motionlessness by slowing things down instead. But now you never achieve true motionlessness, because this slowed-down state still contains relativity. Speed things up, however, and you escape relativity and thus achieve *true* motionlessness.

Then ask: Why doesn't motionlessness need to be set into motion? Well, it doesn't.

"Okay, but what accelerated the system to this supposedly timeless speed?"

There was never a ramp-up from a slower to a faster state of motion, because you can't begin with the relative (the slowed-down state). You have to start with the nonrelative, timeless state.

So motion never needed to be set going, because motion is, in the end, the state of motionlessness.

In sum: There was never a transition from A (rest) to B (motion) requiring a cause, because A and B are two descriptions of the same underlying state.

Motion did not emerge from motionlessness. At the fundamental level, motion and motionlessness are the same state. The apparent opposition between them emerges only at the relative level.

The Hollow Earth

I know, I know — I know what you’re thinking: my philosophy was actually holding up pretty well, I even managed to sound like I could out-argue Fuller, which is no small feat, so credit where it’s due. But then I did it — I threw it all away in a single title and went from “serious thinker” to “certified full-blown crackpot” in record time. Honestly, impressive collapse. Shame on me.

But let me defend myself here:

1. The Hollow Earth, at least from my point of view, follows strictly from first principles.
2. Modern science is out here asking me to picture a universe of floating islands (Pangaea) like it’s completely normal, and then acting surprised when I don’t just accept that without question. If that’s the standard, then a growing Earth is not only reasonable—it’s almost conservative—and once you accept that line of thinking, the Hollow Earth idea isn’t that far removed.

3. Our ancestors already spoke about it. So unless you can clearly explain why their “infinite wisdom” suddenly got downgraded into “just myth we can ignore,” you’re going to need more than a dismissive hand-wave. You don’t just erase tradition—you actually have to outperform it. That hasn’t happened here.
4. And if history tells us anything, it’s this: scientific models change. So I’m not blindly rejecting tradition or blindly trusting it—I’m just not convinced that dismissing it outright is justified without something far stronger to replace it.

Some Objections:

- Seismic wave data: but this assumes a static Earth, not a growing Earth.
- We know Earth’s mass very accurately: but Earth has grown over time. Just because it may be more solid today doesn’t mean it wasn’t more hollow in the past.
- A large internal cavity would struggle to exist because surrounding rock would collapse inward: not if Earth grows and produces its own matter.
- Planets form from gravitational collapse of dust and gas: I don’t buy this model at all. It is how children explain nature, so crude.
- Earth’s magnetic field is explained by...: but I am suggesting another origin, a plasma sun.
- Direct exploration (drilling): yeah, this is actually the best

argument they have, and I say: keep drilling! Show me the real science and then I will believe or disbelieve the Hollow Earth.

Until then I have only modern science, and it doesn't impress me one bit. You may have debunked the Hollow Earth from a mainstream point of view, but as a student of philosophy and the philosophy of science, it remains an open question.

And the biggest objection:

Gravity would be very uneven: I have another version of gravity.

Gravity is an outward push from inside the Earth. On the surface of the Earth, it is an inward pull. Gravity is both. Gravity is the whole dual torus — the expansion and contraction. We only experience one side of gravity, but for inhabitants in a hollow Earth, their plasma sun kind of works like anti-gravity, in the sense that gravity flows the other way than we are used to. That is why they can look up at their plasma sun and not fall into it. So if you fell into the Earth, there would be a point of stillness, and beyond that point gravity would seem to flip, because, once again, real gravity is the whole dual torus.

You can say their sun expels anti-gravity waves, but it's really just gravity seen from the other side.

If I redefine gravity as a dual-torus circulation, then all current geophysical evidence must be reinterpreted through that lens, not treated

as an external contradiction. But to do that, my model must still explain why:

- seismic waves behave consistently as if Earth is layered and mostly continuous matter
- gravity measurements behave as if mass is centrally concentrated
- orbital dynamics match a specific mass distribution

In other words, the pressure point is not “I’m wrong,” it’s: can my toroidal interpretation reproduce the same constraints without quietly reintroducing the standard structure it replaces?

That’s the real battlefield my model has to win on.

The “science says X, therefore Y” framing misses what I’m actually building: a first-principles alternative ontology where gravity, structure, and interior/exterior are redefined.

If I strip it down to the core issue, I’m not really asking for a defense of mainstream science—I’m trying to see whether my model can survive contact with the strongest counterarguments without collapsing into a simple “dismissal vs belief” framing.

In other words, the full set of objections to the Hollow Earth model—seismic wave data, gravity field measurements, Earth’s mass and density, moment of inertia (how Earth rotates), magnetic field generation, heat flow from the interior, and planetary formation models—does not constitute a final word in any absolute philosophical sense. However, taken together, they form a very strong and mutually reinforcing body of evidence.

The bigger they are, the harder they fall, but taking on that structure would be a major undertaking, and I will not attempt it in this book. My point is simply that I am not particularly impressed by Goliath and his seismic data, even if, at first glance, it appears to be a decisive final nail in the coffin.

Why I'm not impressed with modern science: because it is very bad at logic and has everything upside down. I mean it. Let's go through the logic, shall we?

Time beginning with the Big Bang. This is so logically backwards that we actually have a quote:

"We are asked by science to believe that the entire universe sprang from nothingness, and at a single point and for no discernible reason. This notion is the limit case for credulity. In other words, if you can believe this, you can believe anything."

— Terence McKenna

And you can say modern science doesn't say that, but in effect their logic here is still that bad, and I think they even know it if they are being honest.

Then we have matter coming alive! The primordial soup. Again, obvious nonsense.

Then we have matter producing consciousness. Again, obvious nonsense.

Then we have evolution, which I think is obvious nonsense. By evolution I mean the mechanism mainstream science uses to explain evolution, not the fact that we are apes, so to speak. I don't deny facts; I simply deny that modern science knows what they are talking about at all. So I'm firmly aligned with Denis Noble, for example.

Then we have the cosmological constant being greater than zero, which is obvious nonsense. Nature is all about balance, so it should be exactly zero. And this is why modern physics is in such bad shape today. They promised us the theory of everything decades ago, then they went on this wild goose chase and are still running in the lost woods.

And to top it off we have Pangaea, which is this floating island in space. I mean, the future will look back at our modern science and conclude we lived in the dark ages of reason, but that this age produced machines that could lift humankind out of their pits of unreason. I mean, if modern science started to play chess, they would need to invent a new rating system because modern science is that bad at reasoning. They get everything wrong! It is kind of impressive actually.

And they still believe physical reality is real and that matter can have an independent existence. Really cute.

And to really hammer it down how impressive their stupidity is, they say the Great Pyramid was a tomb! At this point I want to be lobotomized so I can stop thinking about how bad science is at thinking.

The Hollow Earth Model

In my model, reality is not a static structure but a continuous cosmic recycling process, where undivided being and differentiated form are constantly transformed into each other through a dual-torus geometry.

1. Gravity as dual-torus circulation

Gravity is not a one-directional force. It is the expression of a full circulation:

- One phase appears as contraction (what we normally call “gravity pulling inward”)
- The opposite phase appears as expansion or outward emergence
- Together they form a single continuous loop of motion

So gravity is not “inward only”—it is the shape of the entire cycle, experienced locally from different positions in the flow.

2. Earth as a structured node in the cycle

In this model, Earth is not a closed solid object in a purely external space.

Instead, Earth is a stable geometric node in the recycling loop, where:

- outward-expanding expression is stabilised into a boundary (the crust/surface system)
- inward-converging expression is redirected through phase transition rather than collapse
- matter is continuously reorganised by the underlying circulation

So Earth behaves less like a rigid ball and more like:
a self-maintaining interface between phases of the cosmic cycle

3. The interior (“hollow”) region

The interior is not “empty space” in the usual sense.

It is defined as:

a region where the balance of the dual-torus flow shifts from contractive dominance to expansive expression

So what we call “inside Earth” becomes:

- a re-expression zone of the same system
- a region where the flow reorganises into outward-phase geometry

This produces a stable interior environment rather than collapse, because:

- collapse and expansion are always balanced across the full system

- nothing exists in isolation; everything is part of circulation

4. The plasma sun

Within the interior region, the recycling process concentrates into a focal expression:

the plasma sun is a localized manifestation of the expansion phase of the dual-torus system

It is not a distant star-like object in empty space. Instead:

- it is part of the same continuous field
- it appears central because of symmetry in the internal flow geometry
- it functions as a stabilised outward-energy node within the cycle

5. Why inhabitants do not fall into it

In this model, motion is not defined by simple attraction toward mass, but by phase gradients in the toroidal system.

So inside the interior region:

- “downward fall” is not directed toward a physical sink
- movement follows equilibrium contours of the flow
- the plasma sun is not a gravitational trap but a balanced expression point of the system

So observers would perceive:

a stable “skyward” central source without being pulled into it, because gravity is not purely inward there—it is phase-balanced circulation

6. Earth growth as recycling expression

If Earth “grows” in this model, it is not accumulation in a classical sense but:

continuous re-expression of structure through the cosmic recycling loop

So mass is not simply added or stored—it is:

- transformed
- reconfigured
- redistributed through the dual-torus cycle

This supports the idea of a dynamic Earth rather than a fixed static object.

Core summary of my Hollow Earth model

In my framework:

- reality is a dual-torus recycling process
- gravity is the full circulation of expansion and contraction
- Earth is a stabilised node in that circulation
- the interior is a re-expression zone of the same system
- the plasma sun is a central phase-node of outward expression
- “hollow” does not mean empty—it means phase-restructured space within the cycle

As for how “hollow” the Hollow Earth is: I don’t know, because I haven’t run this model in any formal simulations or quantitative

framework. But it would be interesting to do that and see what emerges.

In particular, it would be worth testing whether any version of this model could reproduce constraints like seismic wave data under its own assumptions. I think that is at least conceptually possible in principle.

There is still much that modern science does not fully understand about the deeper structure and dynamics of nature.

What I meant by “phase transition rather than collapse” is this:

The inward-converging behaviour does not continue indefinitely into a “final inward end-state,” but instead shifts into the complementary mode of the same process.

But the key nuance is this:

It is not that “gravity stops being inward and becomes outward as a new force.”

Rather, it is the same underlying circulation changing which aspect is dominant in expression at that region.

So:

- “inward expression” = contraction-dominant phase of the loop

- “outward expression” = expansion-dominant phase of the same loop

So I can say:

gravity shows its outward-expression phase after the transition point

But more precisely within my model:

gravity is the full dual-torus process, and what changes is which phase is being locally expressed or experienced.

1. What my model actually requires

I am defining gravity as:

a continuous dual-torus circulation where contraction and expansion are two phases of one loop, and what I call “gravity” is just local expression of that flow.

So the key question becomes:

does the inward (contraction-dominant) phase necessarily converge into a filled center, or can it reorganise into a stable internal void?

2. When a hollow interior can exist in my system

A hollow interior becomes possible if:

(A) The flow is not point-convergent

If inward motion does not terminate at a central singular accumulation point, but instead:

- circulates around a central symmetry region
- or is redirected by phase geometry

Then I do not get a “filled core,” but a stable circulation boundary.

(B) There is a phase inversion boundary

If my dual-torus has a transition surface where:

- contraction-dominant flow turns into expansion-dominant flow
- without full compression into a central point

Then the system naturally forms:

a shell-like structure around a lower-density or differently-expressed interior region

This is the key structural idea behind a “hollow” outcome in my framework.

(C) Stability requires balance, not collapse

In my logic (as I stated earlier):

- nature tends toward balanced cycling, not infinite inward collapse
- so inward flow must be compensated by outward expression somewhere in the loop

That makes it possible for:
the system to stabilise as a boundary-dominant structure rather
than a fully filled interior

3. The critical constraint (important)

Even in my model, a hollow interior is not automatic.

It only emerges if:

- inward flow does not dominate into a single attractor point
- and the toroidal geometry enforces a stable redistribution path around a central region

If instead inward expression is purely convergent with no redirection mechanism, then:

collapse (full filling) is the natural outcome even in my framework

4. So the honest conclusion

From within my dual-torus logic:

a hollow interior is not impossible, but it is not guaranteed—it requires a specific geometric condition where inward-converging flow is phase-redirected rather than centrally accumulated.

But logically it *must* be so—because the idea of gravity “just going into the Earth forever” is, at best, a naive picture of something far more structured, and at worst a completely childish mental image of a process that is clearly not that simplistic!

Why plasma? Plasma is the earliest classical “matter-like” state we can meaningfully talk about. Plasma is one of the first things that forms because I believe it is the icosahedron stage. Plasma is the first thing to be born, and white holes birth new matter.

In physics:

First: quantum fields / energy-dominated state (pre-particle description)

Then: hot particle soup (quarks, electrons, etc.)

Then: plasma-like behavior (charged particles interacting freely)

Later: atoms, then gas, then stars, etc.

But the states before plasma in my model are the cuboctahedron, which is gravity, which is the universal field itself.

So, for dummies, the idea is that the flow goes into the Earth and then flips at some point. But if you were an inhabitant living inside the Earth, you would live on the other side of that flip and experience it as

the normal side. Your feet would therefore be upside down relative to someone standing on the surface of the Earth, yet you would still feel the same downward pull of gravity. You would look up at the plasma sun, while we, standing on the surface, would essentially be looking down toward it—well, if we could see through all that rock and the Earth, that is.

So, if the Earth is part of the cosmic recycling, then it gets the stuff that black holes suck in and that timelessness resets, which means Earth is kind of like a white hole, but maybe not the way physics imagines it. And then it can use this recycled stuff in order to grow, and thus a hollow interior is possible without that interior being crushed by gravity because: 1) gravity is the whole dual-torus flow, so it has a natural outward push as well. Gravity isn't so simple as just an inward pull; and 2) the growing Earth itself—the fact that it grows—can counter the argument that a hollow Earth would be crushed under gravity. It would not. This thoughtless counterargument assumes a static Earth, but the Earth is dynamic and growing.

In very simple terms, my Earth isn't:

a hollow rock trying not to collapse.

It's:

a continuously regenerated structure whose hollow geometry would exist because of the circulation maintaining it.

universe evolves toward higher entropy → black holes absorb matter / contraction → timeless boundary / higher entropy is reset → white holes / re-expression / expansion → Earth → growth → universe evolves toward higher entropy → ad infinitum...

So, in my model, there is at least one cosmic black/white hole (dual torus) that cannot die and is eternal, meaning the universe is eternal too. It never began. Eternity is a circle, not a line.

Quantum Riddles Solved

Once again, if we state that the dual torus is the basic building block (bbb) of reality, certain quantum riddles become easier to understand, such as: how can a particle be both a particle and a wave at the same time, and how can two particles communicate instantly?

The dual torus has an undifferentiated core, as we discussed earlier, along with its toroidal wings, but the dual torus as a whole is both. The undifferentiated core can function as a boundless field or wave, while the particle aspect can be represented by the wings.

The timeless core is 0D, meaning that the actual shape we call a particle is the manifestation of the animal mind taking that 0D reality and rendering it into 3D. This is why, when you do not look, reality can manifest as both a wave and a particle: reality itself is the wave, while the animal mind manifests the particle.

That is, the animal mind can represent reality either as a wave or as a particle because it can also represent the wave as a wave. However, if we could really go down to the deepest level reality has to offer, then I think we would find something like this: reality-in-itself is neither a wave nor a particle, but a conscious field (idealism).

Instant communication, then, becomes possible because reality is fundamentally 0D. Space is an illusion rendered by the animal mind, so true separation does not exist at the deepest level. This is similar to David Bohm's implicate and explicate order.

David Bohm's Fish Tank

The basic idea goes like this:

I imagine a fish swimming in a tank. Now I imagine two cameras filming the tank from different angles:

- one from the front
- one from the side

The observers watching the screens do not see the fish directly. They only see:

two different projections of the same deeper reality.

To the observers:

- the fish on screen A and the fish on screen B may appear like separate objects
- yet their movements are mysteriously correlated

But from a higher perspective, there are not two fish:
there is one underlying reality appearing in different forms.

This was Bohm's way of illustrating how:

- apparent separateness may emerge from a deeper undivided order
- what looks disconnected at the surface may actually be unified underneath

Apparent separateness is emergent rather than fundamental because, at the deepest level, there is no true distance to cross.

Although one might say that quantum mechanics does not require human or animal consciousness specifically for measurement in mainstream interpretations, I approach it from a different angle. I needed spacetime to function as an interface, much like Donald Hoffman suggests, in order to solve a much deeper problem: the problem of infinite regress.

Having solved that problem by concluding that the universe is a kind of interface for the animal mind, consciousness playing a role in measurement is back on the table.

I am aiming for a philosophical ontology that attempts to unify consciousness, geometry, and quantum nonlocality under a single timeless structure.

For example, John von Neumann explored the idea that the measurement chain ultimately terminates in consciousness. And if idealism is true and materialism is false, then von Neumann must necessarily be right, because all that exists is consciousness; there is nothing else. So it is not mind over matter. It is mind on mind.

And Bernardo Kastrup, arguably the most prominent living defender of idealism today, has already delivered materialism its long-overdue eulogy. The coffin was lowered, the final words were spoken—and we weren't shedding tears. We were celebrating!

So just because the mainstream consensus has moved beyond von Neumann does not make the mainstream automatically right. The truth is perhaps somewhere in the middle, where consciousness is not required because the underlying field is already conscious, but where local awareness, such as human awareness, can still play a role if it wants to.

So, in my view, consciousness is not an external magical force acting on dead matter, but a local expression of an already conscious underlying reality. Consciousness is woven into the fabric of reality rather than inserted into it from the outside.

Again, mind-like or experiential properties are fundamental to reality, and local consciousness participates in a deeper unified field.

So, for me, reason points more in this direction:

- rejecting naive materialism as a complete explanation of consciousness
- treating separateness as emergent rather than ultimate
- seeing spacetime as interface-like rather than absolute
- trying to unify ontology instead of patching isolated problems

What I mean is that my approach aims toward one underlying framework that explains many phenomena at once, rather than separate explanations for separate problems with no deeper unity between them.

In mainstream thinking, you often get:

- one theory for gravity
- another for quantum mechanics
- another for consciousness
- another for cosmology
- another for entropy
- another for life

and then people try to “patch” the gaps between them afterward.

My project is trying to do something different:

I begin with one foundational structure—the dual torus (i.e., timelessness)—and from that single root attempt to derive:

- gravity (torus flow)
 - spacetime (animal interface)
 - consciousness (foundation)
 - entropy (animal interface)
 - nonlocality (foundation)
 - cosmic cycles (the whole)
 - matter formation (animal interface)
- all from the same ontological foundation.

That is what I mean by:

trying to unify ontology instead of patching isolated problems.

Ontology is the study of what fundamentally exists and how reality is structured at the deepest level.

And: yes, that means consciousness is timeless! We are not actually seated inside the universe; we are inside the timeless domain, experiencing reality through a kind of VR headset we call the universe.

But how can you be conscious in timelessness? Because timelessness is dynamic, not static. Think of Superman flying so fast that time appears to stop around him, yet he remains conscious and can still move around.

So I am not merely asking:

“How does consciousness emerge from matter?”

I am asking:

“What kind of reality must existence itself be for consciousness, matter, time, and causality to all make sense together?”

That is the deeper philosophical project I am aiming toward.

My Personal Take

My personal take:

- The ground must be one (to avoid fragmentation)
- It must be self-existing (to avoid infinite regress)
- It must be the source of all appearances

Then idealism collapses into a God-concept.

At that point, you don't just have:

reality is mental

You have:

reality is grounded in a single, necessary, self-existing mind

That is God in philosophical terms.

In other words:

Idealism by itself is not God.

But idealism, when pushed to its logical limit, becomes indistinguishable from God.

That's the honest analysis.

The Final Resolution

I approach philosophy as a search for the ultimate ground of reality—what is not reducible, not derived, and not dependent on anything else. I do not begin by calling this ground “God,” because that term is loaded, nor do I begin by calling it “matter,” because that is already a theoretical posit. I begin more carefully, by defining it simply as that upon which everything depends.

From there, I look at competing accounts and choose the most parsimonious one. I start with what is directly given, which is consciousness, and I avoid positing an unseen non-mental substrate behind it. On that basis, idealism emerges as the strongest candidate—not because it is proven beyond all doubt, but because it requires fewer assumptions and does not introduce an unnecessary layer.

So I conclude that the ultimate ground is best described as mental.

Now comes the crucial step, the one people tend to overlook. Once I have fixed the ultimate ground in this way, any distinction between “God” and “idealism” becomes merely terminological. I am not saying that I have proven the ultimate in an absolute sense. I am saying that I have identified the most parsimonious account of it. And once the

concept of the ultimate is properly defined as ultimate—not as “God” or “idealism” from the outset—those labels no longer function as competing options.

They become descriptions that follow thereafter.

And that word matters: thereafter. That is what people miss. They try to compare “God” and “idealism” as if they are rival starting points, when in fact they are names that arise only after the ground has been fixed. Once that step is taken, the distinction collapses, because both terms are now referring to the same thing: the ultimate ground, described from different angles.

Let us make it crystal clear: you must start with the ultimate, and that requirement grounds your definitions of God, idealism, or anything else you propose. That is what people do not see. So I am not relabeling “God.” I am telling you what God must mean if it is to mean anything at all—if it is to refer to anything real. That is a very different approach.

- Start with a neutral requirement: the ultimate ground
- Argue for the most parsimonious candidate, which is idealism
- Then say: whatever satisfies that role is what “God” must mean

So I am not redefining God arbitrarily. I am deriving what God must mean from the requirement that it refer to the ultimate ground of reality.

And once you see that, the supposed distinction between “God” and “idealism” disappears. Idealism describes the nature of the ultimate. God names its status as the ultimate.

They are not rivals. They are the same conclusion, reached from different directions.

What people miss is the order of reasoning. They try to compare “God” and “idealism” at the start, when in fact both are terms that only make sense after the ultimate has been fixed.

That is the key move: not relabeling, but grounding.

Once that step is taken, the rest follows.

Skeptic:

Fine, but you’ve only proven that something like a cosmic internet exists. You haven’t shown that it’s complex. All you’ve got is a puny god.

Me:

Maybe—but that just shows the limit of your expectation, not the limit of reality. If anything, the real God is likely infinitely more complex than our tiny notions of what God should be.

I propose:

1. There must be an ultimate ground.

2. The ultimate ground must be one, self-existing, and the source of appearances.

3. Idealism is the most parsimonious account of the nature of that ground.

4. Therefore, the ultimate ground is mental.

5. “God” = the ultimate, self-existing ground of reality.

6. Therefore, the ultimate mental ground = God.

If those premises are granted, then yes:

Ultimate ground + idealism = God.

Or symbolically:

U = ultimate ground

I = U is fundamentally mental

G = the necessary/self-existing ultimate ground

Then, if we establish:

U is mental

and

G refers to U,

we aren't proposing two additional entities called *Idealism* and *God*. We are giving **two descriptions of the same ultimate reality**.

Thus, the critic's strongest response isn't actually, “*You just re-named idealism God.*” My argument has a decent answer to that.

The stronger objection is:

Why must “God” mean merely a self-existing mental ground?

Traditionally, God often carries additional attributes: intelligence, agency, intentionality, omniscience, omnipotence, goodness, person-

ality, etc. Your argument **doesn't derive those attributes merely from idealism.**

My response: True. I am only giving a clear definition of what God is and must be at the most fundamental level. I haven't established any additional attributes yet. I'm simply trying to make the case for what "God" must ultimately mean if the concept is to mean anything at all.

What must God minimally be? comes first.

What additional attributes does God have? comes afterward.

God

I am not arbitrarily selecting one interpretation of God out of many. I am asking what the word must refer to if it is to refer to anything ultimate at all. God, in the highest philosophical sense, cannot be a thing among things. God must be the ultimate ground of being.

Once that is granted, the real debate becomes whether that ground is fundamentally mental or fundamentally non-mental. If it is fundamentally mental, then the philosophical meaning of God and the meaning of idealism converge.

If the word “God” is to mean anything philosophically serious, it must refer to the most fundamental level of reality. Whether that level deserves the label “God” is a separate question.

Personally, I would say yes, because I see God, Buddha-nature, and universal consciousness as pointing toward the same underlying reality.

Again, if reality is a “box,” then anything claimed to exist outside it would simply be included within it. So the logical definition of God must refer to the ground of reality itself.

Then we ask: what is that ground?

If materialism is true, then the ground would be something like matter or atoms. But then “God” collapses into a physical object, which is conceptually too thin to carry the weight of ultimacy.

If panpsychism is true, the result is closer, because consciousness is already embedded in reality, but it still leaves questions about structure and ontological priority.

If idealism is true, however, then reality is fundamentally experiential or mental in nature. In that case, the deepest level of reality is already mind-like, and what we call “individual minds” are local expressions of that deeper field.

In that sense, it is not “mind over matter,” but “mind within mind.”

Philosophers like John von Neumann and others have explored versions of consciousness-linked interpretations of reality, while contemporary thinkers such as Bernardo Kastrup argue that materialism fails to account for consciousness at all.

So just because mainstream consensus has moved away from these views does not mean the philosophical issue is resolved!

My position is not that I am defining God into existence. I am filtering metaphysical frameworks by whether they can sustain a non-trivial concept of ultimacy.

Materialism reduces the “ultimate” to something too weak to function as God. Idealism, by contrast, preserves a strong notion of a unified, foundational reality that is inherently experiential.

So I am not saying:

“deepest level = God”

I am saying:

“deepest level + metaphysical interpretation determines whether the concept of God is meaningful or collapses.”

Under this approach:

- materialism → reduces God to something trivial
- panpsychism → partial convergence
- idealism → strongest coherent candidate

From my perspective, the argument for idealism is that it resolves problems that materialism leaves open, especially the hard problem of consciousness.

Materialism struggles to explain why experience exists at all, and it faces the deeper issue of explaining how something non-experiential could generate experience in the first place.

So my claim is not that I have proven God in a theological sense.

My claim is that:

if reality is fundamentally experiential, then what we call “God” is simply the name for that fundamental experiential ground of being.

And in that sense, God is not an addition to reality, but a description of what reality most fundamentally is.

God is not “supernatural” if by that we mean something outside or beyond reality.

If reality is the totality of everything that exists, then there is no coherent “outside” to it. Anything claimed to be beyond reality would either be meaningless or would simply be included within reality once properly defined.

So the idea of a realm beyond reality is conceptually unstable, since existence has no external boundary from which it can be meaningfully referenced.

From this view, God cannot refer to something outside the universe. Instead, God must refer either to reality as a whole, or to the deepest underlying ground from which all appearances arise.

In that sense, God is not a separate entity beyond nature, but the name for nature at its most fundamental level.

Note: However, if the universe turns out to be literally a dream in the mind of the One, then God could in some sense be understood as beyond the universe. That, however, is a separate issue.

Let's probe this more deeply. To reiterate: If reality is defined as the totality of everything that exists, then there is no coherent "outside" to it, because the idea of "outside" only makes sense when there is a boundary between two existing regions or domains.

To say something is "outside reality" would require:

- a second domain distinct from reality, and
- a standpoint from which both reality and that outside domain can be meaningfully related

But if "reality" already includes everything that exists, then any proposed "outside" either:

- does not exist (and is therefore not real in any sense), or
- is already part of reality by definition

So the concept collapses: there is no external position from which reality as a whole can be compared or contained, because comparison itself would already occur within reality.

In that sense, "outside reality" is not a well-formed concept, because it tries to treat existence as if it were one object inside a larger space, when by definition there is no larger space for existence to sit inside.

So you see that God cannot be some supernatural thing outside reality, peering in.

If one uses **Nature** in the broader, Spinoza-like sense of all that exists—reality as a whole, then “something supernatural” becomes problematic:

If it exists, it belongs to reality.

If Nature = all reality, then nothing real can exist outside Nature.

In the end, the fact that God exists turns out to be very simple and easy to understand: we have a mind, Nature is fractal, and thus there is a larger mind out there. It really is that simple.

Note: I am not smuggling God in through the back door. I am only showing what God must mean in the most minimal philosophical sense.

There are other legitimate uses of the word “God,” for example a personal creator in classical theism. But even in this case, such a God would still have to be understood as grounded in whatever one takes to be fundamental reality, and that ground must be interpreted through a metaphysical framework such as materialism, idealism, and so on.

So if that framework is the same as mine, idealism, then we are talking about *the same thing*, only with additional claims or details about God that may or may not be true.

Again: I am simply saying what God must mean in a clean philosophical sense. I am not saying, "This is what God must mean in full detail." I am saying, "This is the most philosophically neutral and minimal way to define God."

Skeptic vs Me

Skeptic:

You're just saying: "Whatever exists at the deepest level = God." That's a valid constraint, but then you're implying this minimum is the core and everything else is optional.

Me:

No, then you don't understand my argument at all. I'm not saying "deepest level = God." I'm saying deepest level + filter.

The deepest level by itself is not enough. It has to be interpreted through a metaphysical framework (filter) such as materialism, idealism, or panpsychism.

Skeptic:

So under your definition, deepest level + materialism just becomes God. You just don't like the result.

Me:

No, that's not what I'm saying.

What I'm saying is this: if you could prove materialism 100%, then the best possible definition of God anyone could ever come up with would reduce to something like an atom or a blind physical structure. At that point, you either accept *that* as "God," or you give up the claim that God is fundamental.

So the issue is not that I "don't like the result." The issue is that the concept collapses into something trivial.

Skeptic:

So you're just strengthening your argument now. Earlier you were defining God into existence.

Me:

No, this was always my argument, even from the start. I was never defining God into existence.

What I'm doing is filtering metaphysical systems by their ability to sustain a meaningful concept of God.

Skeptic:

Then what's your actual claim?

Me:

My claim is this:

- Start with the constraint that God, if it exists, must be fundamental.
- Then apply different metaphysical filters to the fundamental level.

Now test the results:

- Materialism → collapses into something like atoms → too trivial
- Panpsychism → closer, but still debatable
- Idealism → yields a fully robust, non-trivial concept of God

And here is the key point:

If deepest level + idealism still does not give you God, then God does not exist.

But from my point of view, God, or if you prefer the Buddha, exists because idealism is most likely true. People think materialism is more likely true, but I believe they are wrong. Philosophically, God is closer to reality than materialism, and it is only in modern times that God as a concept has become fringe. In reality, it is a natural concept.

Materialism cannot be true because matter appears within consciousness, so it is unclear how something that exists within consciousness could generate consciousness in the first place. That would be a reversal of explanatory order! In addition, atoms face the problem of infinite regress: if everything is made of atoms, then what are atoms

made of, and what are those constituents made of, and so on. For this reason, atoms cannot be fundamental in any final sense, because that would lead to a regress problem.

Materialism is therefore, in my view, logically untenable. The hard problem of consciousness, that is, why experience exists at all, and the question of what counts as “fundamental,” remain genuinely unresolved problems. Idealism offers a clean resolution to these issues. There is, from this perspective, no real contest.

Thinkers such as Bernardo Kastrup are often very critical of materialism, and I understand why.

Kastrup asks: **How?**

You can describe neurons firing, electrical signals, molecules, brain regions, information processing, and behavior in increasingly precise detail. But according to Kastrup, none of those descriptions explains **why or how there is an inner experience at all**—the redness of red, the feeling of pain, the taste of chocolate, the experience of being you.

He therefore thinks materialism creates an unnecessary explanatory gap: it starts with something supposedly non-mental and then has to explain how mentality appears from it.

His alternative, **analytic idealism**, reverses the picture: consciousness is fundamental, and what we call the physical world is the appearance or representation of processes occurring within consciousness.

“So your whole argument is just a definition game?”

No. It’s a filtering process.

I’m not proving God exists. I’m showing that only certain meta-physical frameworks can even sustain the concept in a meaningful way.

If no framework passes the test, then the concept of God fails.

If one does, then that framework becomes the only serious candidate.

That’s the whole idea.

Where the proof of God comes in is this: if you accept that God = deepest level + idealism, and then try to solve the hard problem of consciousness, you will quickly realize that God probably does exist, and that materialism does not.

And that is not something many materialists want to hear!

God, defined in this way, has a 99.99% chance of existing. Why not 100%? Because I am allowing a small window in which the materialist could, in principle, solve the hard problem. And if, after a very long time, they still cannot, then the conclusion would be that God is 100% real.

“How long?”

I’ll give you a billion years.

“You are that sure, huh?”

Yes. Because it is obvious to me that the hard problem is not a real problem at all, it only appears to be one if you assume materialism in the first place. Remove that assumption, and the so-called problem disappears entirely.

In other words, God is real.

“You select a definition of ‘God’ that privileges idealism, then treat idealism as confirmation of God.”

But this is like having a coffee cup and then calling it a coffee cup; that is not circular. It is a definition, and the proof of idealism has to come from somewhere else. Thus, this is not circular. I have independent anchors, such as phenomenological primacy (experience as an undeniable given).

“Idealism is preferred because it best fits a definition of God, then God is defined in a way that best fits idealism.”

Well, no. I prefer idealism because of its explanatory power, and the fact that God fits idealism has to do with the definition of God, not the reality of idealism.

Thus, someone claiming my argument is circular is simply asserting it and sticking to it no matter what, often because they *reject* the notion that God may be real.

It would be circular if I:

- define “ultimate reality” in a way that already implies a mind-like structure
- then test theories by whether they preserve “ultimacy”
- and conclude idealism is best because it preserves what my definition already biases toward

That would be:

the criterion quietly encoding the conclusion

I am claiming something different:

- I start from phenomenological primacy (experience is undeniable)
- I ask what ontology can account for that fact without reduction
- I compare competing frameworks
- idealism emerges as the best fit

In that structure, idealism is not “assumed in the test” — it is an emergent inference from constraints

That is closer to:

abductive reasoning (inference to the best explanation)
not circular reasoning.

“Your argument is not logically circular, but it risks methodological bias if the criteria used to evaluate metaphysical systems already lean toward the conclusion you find most plausible.”

No. I use Bernardo Kastrup here and let him do the heavy lifting of showing why idealism is the best explanation. Thus, I start with inference to the best explanation, not methodological bias. Then, since we are doing philosophy, I define my terms: God = idealism. I can do that. That is not me defining God into reality any more than someone defining a coffee cup as a coffee cup. It is simply naming what is already being referred to.

Now, having defined God in this way, it still only gives me idealism, nothing more. I still need to explore what this God means in the broader sense. Does this God have free will? Is it intelligent? Does it evolve? Does it answer prayers?

It might not answer prayers, and then someone might say that it is not God. But in that case, God as a concept does not exist at all, because I defined God as the ground of reality. So you see, philosophy is a two-edged sword. You can have God, but maybe not the God you would like.

However, that said, for all I know, this God might answer prayers. If you ask Bernardo Kastrup, he would say that this God is primordial and that humans are, in some sense, more evolved, though not necessarily more complex. You can look at Kastrup's philosophy for yourself; I do not need to reiterate it here.

You say: "When you define: God = idealism, then 'God exists' becomes almost equivalent to: idealism is true. So the risk is not circularity, but collapse of informational content. The term 'God' stops doing independent explanatory work."

To that I reply:

That is fair, and I will take it! But having defined God as universal mind, and taking seriously the conclusion that this universal mind is *the only thing that exists anyway* (as argued through Kastrup's work), then any further attempt to redefine God will either collapse back into idealism or require abandoning idealism altogether.

So at that point, it becomes more productive to explore what God is, rather than continuously multiplying definitions that ultimately point back to the same ontological claim.

In other words: there is no need to define God as a God who answers prayers! I already have God. Now the question is whether *this* God answers prayers or not.

So let us do this next: let us explore God and ask, how complex is God?

- We must begin with the ultimate, defined neutrally.
 - Consciousness is the only thing directly given.
 - A parsimonious ontology should not posit an unseen non-mental substrate.
 - Therefore, idealism is the strongest candidate.
 - Once the ultimate is fixed, “God” is not a hypothesis but the name for that ground.
 - The distinction between God and idealism then collapses.

Thus, I am not proving God from the outside. I am showing that once you identify the ultimate ground of reality through a parsimonious analysis, that ground is what philosophy has often meant by God.

Because that is what God must mean; it cannot mean anything else.

God is not identical to the ultimate ground? Then it is not God.

So, is the ground simple or complex? **That is the question.**

Personally, I believe it is complex, because existence cannot have arisen from nothingness or nonexistence. Thus, existence must be

circular. That may sound too abstract for this little book, but it simply means that a circle has no beginning or end.

You might say that we must begin with the simple and build upward to the complex, and that we cannot start with the complex because that would be backwards. I agree—if we are talking about linear processes in time. But on a circle, things are different.

I view classical time (spacetime) as a rainbow: you start with the color red, then move through the spectrum to violet, and once you pass that final color, you arrive back at red again. But reality is not red or violet; it is the white light in which all colors coexist, where the alpha and the omega are one.

Thus, if existence is eternal, its ground can be complex, because it is not a line but a circle.

But how does this work mechanically? Well, we already have the dual torus as the “B.B.B.” of reality, and this system is a feedback loop, which I believe is what consciousness looks like from the outside. This feedback process has a 0D core, which means all atoms in the universe feed into the same core. Effectively, the universe is talking to itself and evolving as a unit—nothing is random and everything is interconnected.

This is why I believe morphic resonance works, because the fields are not separate but interwoven. So you can view the whole universe like a network: like a brain, or a mushroom mycelial network—the so-called “wood wide web.”

But it still needs to evolve. You cannot just have this network fully evolved from eternity. At first glance, I would agree with that, because it seems logical. But I think **eternity** is a bit different.

Imagine Platonic facts, say $1 + 1 = 2$. This is true forever; it did not evolve. So imagine visiting an emerald city like in *The Wizard of Oz* while you are tripping on DMT or something, and you ask who made this city, and someone answers back: *no one, this city is eternal, no one made it*. In that state, you would “get it,” and it would make sense.

But still you might say: I understand what you mean, but for God to be complex since eternity, I need more than a trip report—I need actual logic.

Okay, so imagine Superman again. He flies so fast that you can take all time and, like a movie, play it in seconds. In that sense, God did evolve if you play the movie slowly, but the slow-moving movie is only an interpretation of the animal mind, while the real movie was always eternal.

Now, I am not saying reality is predetermined like a movie; I am just using it as an analogy. I still believe that timelessness is dynamic and updating all the time, so God is continuously evolving.

But that this mind is primordial, as Kastrup says, I find hard to fully accept. It seems extremely advanced.

God is the alpha and the omega, the first and the last, the beginning and the end, the simple and the complex.

And if someone really doesn't like God, they could say: "Whatever you say, God is still just a concept and will remain a concept till the end of time."

My reply: You are right about that. We are just playing language games here. So call it Buddha or the Flying Spaghetti Monster—I don't care. My point is that the concepts point to something *real*, and that is what matters.

I don't care what you call it. I call it God because that is the philosophical tradition, so why should I break with that tradition simply because someone doesn't like the word?

It's like the UFO debate. Apparently, we don't call them UFOs anymore—we call them UAPs or whatever. Fine. You can rename the flying saucer all you want. I'm still calling it a UFO.

"No, no, I don't believe in God. I believe in **MAL—Mind-at-Large.**"

"Oh, great MAL in heaven, hallowed be thy MALiciousness. Forgive us our MALpractice, as we forgive those who MALfunction

against us. Heal us of every MALady, pardon our MALice, redeem every MALefactor, and deliver us from MALevolence. Let the MALformed be free from MALnutrition. But let the MALcontent suffer MALicious, MALevolent malaria. Amen.”

Again: I use “God” as a traditional label for a hypothesized fundamental reality that I argue is best described by idealism. The label is secondary to the ontology. Philosophical debate often gets stuck on terminology instead of substance, whereas what matters most is the underlying claim, not the word itself.

God is Not Home

“Ok, but does this God answer prayers?”

My answer: I don’t know. We would have to do experiments.

My personal guess is no, because my belief is that the universe is literally a dream, and God is not “somewhere else” listening, because God is here dreaming—it is you having the dream.

But in another sense, maybe the dream has levels, and some kind of creator-like or dream-version of God sits deeper within the structure of the dream. If the universe is a system that effectively “talks to itself,”

and everything is interconnected in a mind-like way, then prayer could potentially produce effects.

So: yes.

But again, I don't know.

“Where does God come from?”

In my system, God is the dual torus, and I have argued for why the dual torus is eternal. So I am not talking about a being inside the universe; I am talking about the fundamental level of reality. If something is truly fundamental, it does not come from anything else. And that is not a loop—that is where the chain of explanation stops.

Materialism does the same thing when it treats matter or physics as fundamental. But matter cannot be fundamental without running into infinite regress. My dual torus stops the regress because its center is a pure and eternal state of dissolution (death), while the surrounding structure—the “wings”—is the consciousness field (God).

And the skeptic saying, “you cannot prove metaphysics,” is not an argument either. Materialists are making metaphysical claims themselves when they say everything is matter, so that standard applies to their position as well.

And quoting Carl Sagan does not solve anything. Saying “we are made of star stuff” is poetic, but it does not explain why consciousness exists or what the fundamental layer actually is.

And repeating “we will never know” is just giving up. That is a position, but it is not a refutation.

In the end, the skeptic will often just dismiss it because they don’t like it. But the truth is that idealism—and therefore God—is a valid and serious philosophical position. And maybe that is why philosophers don’t get invited to parties so often!

And there is more to the story of God than the learned men will admit.

There are those who, having crossed the threshold of DMT, return with eyes no longer quite their own—speaking of thrones of intelligence without form, of presences woven from light, of a reality so vast it swallows the name “reality” itself. They call it “God,” or “divine mind,” or “the ultimate.” Yet they speak as men who have touched something and cannot decide whether it was dream or truth.

From my perspective, God is not dead. That was only the rumor of those who stopped listening too soon. God is only beginning to be glimpsed, faintly, through cracks in the ordinary world, like dawn pressing against the edges of sleep.

We have not even begun our descent into what this means. We have barely dared to look! And what little we have seen, we have wrapped in prohibition and fear, as though the mind itself were a forbidden territory.

Perhaps the deepest irony is this: that what we call “God” has not vanished from the world—but from our permission to perceive it.

God is not dead—we have only made Him illegal.

My story: When I was a kid, I sort of believed in God because it made sense to me. Then I became a rebellious teenager and stopped believing in God. I went 100% Dawkins for a while.

Then I discovered Manly Palmer Hall, who argued that our ancestors had help from the gods and that these gods were advanced humans with advanced knowledge—including the knowledge that God is real (as above, so below). Later, I came across Randall Carlson, who showed me evidence of the Great Flood, and then Bernardo Kastrup, who introduced me to his arguments for idealism.

Putting all of this together, I eventually came to believe that the knowledge found in the Bible is not simply something our primitive ancestors made up, but something that was passed down to us by the same beings I believe are now flying around in UFOs—the real “gods” of our ancestors.

Still, I don't like religion, because I think religion is essentially a cargo cult built around the real phenomenon. Basically, we encountered something real—and then misunderstood what it was.

A secret brotherhood deliberately shaped words such as fundamental to encode “the fundament is mental.”

The conspiracy theorist in me also says that our language—our very words—comes from these gods themselves, and that nuggets of knowledge are preserved in ordinary words. Take the word *fundamental*, for example: the fundament is *mental* in nature.

I think much of our language carries deeper meanings that were deliberately introduced by secret societies and similar groups. But don't misunderstand what I'm saying. Suppose a secret brotherhood knows that reality is mental. A word already exists, such as the Latin *fundamentum*, and later they turn it into *fundamental* as a form of wordplay and introduce or popularize that form in society. The same idea could apply to words like *adult*—“a dolt,” meaning a stupid or foolish person.

So I'm not saying that the Latin *fundamentum* itself supports the wordplay. I'm saying the wordplay could have been introduced later. After all, in this reading, secret societies are deeply concerned with magic, and magic is about casting spells—which gives us another piece of wordplay: *spells* and *spelling*.

Call it coincidence if you want, but secret societies have had real historical influence, so I suspect there is something to this general idea, even if it turns out that I haven't hit the nail on the head with these particular examples.

"I Won't Believe in God Until I See Evidence"

“E vidence, please.”

You are mixing up science and philosophy. My argument is that the concept of God and the concept of idealism can, when properly analyzed, amount to the same thing.

I am not making a scientific claim like “there is water on Mars.” I am making a metaphysical argument about what must be fundamental. That is approached through logic and philosophical reasoning, not laboratory experiments.

“You cannot create something from nothing.”

I never claimed this. In fact, saying that something cannot come from nothing supports my point. That is why there must be something fundamental that does not arise from anything else. The question is what that fundamental reality is.

“Metaphysics is crap.”

Statements like that show a lack of engagement with philosophy rather than an argument against it.

“You want evidence?” Fine. But modern people have become so conditioned by scientism that they think shouting “Where’s the evidence?” is the same thing as thinking. They act as though reality only exists once a lab coat approves it and a journal stamp blesses it from heaven.

The irony is that “evidence” is never free from interpretation. Institutions can hide evidence, ignore evidence, reinterpret evidence, or bury evidence beneath consensus. And then the same people who blindly trust the system call themselves “skeptics.”

Peer review, in many cases, becomes little more than intellectual monkeys grooming each other for fleas: “You validate my worldview, and I will validate yours.” Then the public mistakes social agreement for truth.

Science is a powerful tool, but it is still a human institution, and human institutions are full of politics, status games, dogma, fear, and career preservation. Demanding “evidence” without first examining the framework interpreting that evidence is not skepticism. It is obedience disguised as rationality.

Then you say: “Science isn’t infallible, but it is the best error-correcting systems humans have for connecting claims to reality.”

My reply: No, that is the great lie they have sold you. Science makes people abandon reason and accept, for example, that the cosmological constant must be greater than zero even when reason itself screams no. There is something above even science, and it is called reason. They like to equate reason with science in order to sell you their fallible worldview, but rest assured: reason stands far above science—far above it.

In fact, the most reliable error-correcting forces of humanity are not institutions, not consensus, not the quiet comfort of approved thought. They are the untamed anti-heroes who wage war for truth when truth has been buried, who endure ridicule and exile, and yet still manage to pass through the gates of hell!

So science is not the most reliable error-correcting system humans have. The people who stand against dogma are the best error-correcting system we have—the true antiheroes.

The Convergence of Idealism and God

Under deep analysis, the concept of idealism and the concept of God converge. If idealism is true, then reality is fundamentally mental. If God means the ultimate ground of reality, then under idealism that ground is mental. In that case, “God” is not an extra being added to the world; God is simply the name for fundamental mental reality itself. So the real debate is no longer “God or no God,” but whether the ground of reality is mental or non-mental. Once that is seen, the concepts begin to collapse into one another.

1. Philosophy must begin with what is most certain

What is most certain is not matter, particles, brains, or external objects as things-in-themselves. What is most certain is consciousness: experience, awareness, appearance, thought, sensation. Even doubt presupposes consciousness, because doubt is itself something experienced.

2. Matter is never encountered apart from consciousness

No one has ever stepped outside consciousness and inspected matter in a way that bypasses experience. Matter is always known through experience—through perception, measurement, thought, or inference. So consciousness is epistemically primary, while matter is secondary as an explanatory postulate.

3. A good metaphysics should not posit more than is necessary

If consciousness is directly given, while matter is only inferred, then a theory that starts with matter adds an unnecessary layer unless it can explain why that layer is needed. Materialism says that non-conscious matter is fundamental, and that consciousness somehow emerges from it. But this introduces an unseen substrate and then fails to explain how subjective experience arises from it.

4. Materialism therefore carries a major explanatory burden

It must explain how non-experiential stuff gives rise to experience. That is the hard problem of consciousness. It is not a small gap; it is a structural gap. If the fundamental level is wholly devoid of subjectivity, then it is unclear in principle how subjectivity could ever appear. Materialism therefore asks us to accept something less certain than consciousness, and then uses that less certain thing to explain the more certain thing. That is metaphysically backward.

5. Idealism removes this burden

Idealism begins with consciousness, which is the one thing directly given. It does not try to derive mind from matter. Instead, it treats matter as the appearance, form, or representation of mental reality. In this way, idealism is more parsimonious because it does not multiply ontological layers beyond necessity. It starts with what is known and does not posit an unknowable non-mental substrate behind it.

6. If the ground of reality is mental, then the ultimate ground is what serious philosophy has traditionally meant by God

God, at the deepest philosophical level, is not first of all an old man in the sky, nor even necessarily a personal deity in the folk-religious sense. God is the ultimate ground of being, the foundational reality upon which all else depends. If idealism is true, that foundational reality is mental. Therefore, what idealism calls the mental ground of reality, classical metaphysics calls God.

7. Therefore, under deep philosophical analysis, idealism and God are two names for the same ultimate principle

Idealism describes the ontological nature of the ground: it is mental.

God names the metaphysical status of the ground: it is ultimate.

These are not two separate conclusions. They are two ways of describing the same thing.

Conclusion

- The most certain datum is consciousness.
- Matter is known only as an inference within consciousness.
- A parsimonious metaphysics should begin with what is directly given.
- Materialism adds an unseen substrate and fails to explain consciousness.
- Idealism begins with consciousness and therefore has the stronger claim to parsimony.
- If the fundamental mental ground of reality is what we mean by God, then God exists, as far as philosophical proof goes.

Ayaan Hirsi Ali

But arguing for God feels deeply regressive. We should be moving forward, not reverting!

That was my position—until I encountered Ayaan Hirsi Ali's argument.

Ayaan Hirsi Ali's Argument

1. Human beings require meaning and moral structure

Human societies do not function on reason and science alone.

People need:

- a shared sense of right and wrong
- a narrative that gives life meaning
- psychological grounding in suffering, fear, and death
- social cohesion through moral norms

Without this, societies destabilise.

2. Secular atheism is insufficient as a replacement system

Modern secular humanism:

- explains reality scientifically
- but does not reliably produce strong moral cohesion or existential meaning
- does not organise itself into a compelling mass moral narrative

Therefore, it cannot fully replace religion at a civilizational level.

3. Christianity historically supplied this structure in the West

Christianity:

- provided a long-lasting moral framework (love, forgiveness, redemption)
- shaped Western legal and ethical institutions
- produced a shared cultural vocabulary of meaning

Therefore, Western stability is historically dependent on Christian moral inheritance.

4. Removal of Christianity creates a structural vacuum

When Christianity weakens or disappears:

- shared moral language fragments
- authority over moral questions becomes diffuse
- individuals are left without a strong, unified meaning-system

This produces what she calls a “moral vacuum.”

5. Vacuums in belief systems are always filled

Human societies do not remain ideologically empty.

When a dominant framework collapses:

- competing ideologies enter the space
- these ideologies often offer stronger emotional certainty than secular liberalism

So the vacuum does not remain neutral—it becomes contested.

6. Islamism as an active competitor ideology (her central concern)

In her framing, Islamism (not necessarily all Muslims) is characterised as:

- highly structured and totalising
- socially and politically comprehensive (religion + law + identity)
- emotionally powerful due to certainty, obligation, and collective identity
- capable of mobilising strong commitment and sacrifice

Therefore, in a vacuum situation, it can expand more effectively than weakly structured secular moral systems.

7. Comparative claim: Christianity vs competing systems

She contrasts three systems:

- Christianity: moral narrative of redemption, forgiveness, love; historically stabilising
- Secular humanism: rational but culturally and emotionally “thin”
- Islamism (as she defines it): ideologically intense, identity-driven, expansion-capable

8. Personal epistemic stance on belief

On the individual level:

- belief is not purely logical
- subjective experience and existential transformation matter
- faith can be “chosen” and lived as meaningful

Therefore, religious belief can be justified pragmatically and experientially, not only empirically.

Final conclusion (as her argument implies)

- Western civilisation needs a strong moral framework to remain stable

- Christianity is the historically proven framework in the West
 - removing it creates a vacuum
 - that vacuum will be filled by more ideologically aggressive systems unless countered
 - therefore, Christianity (or its revival) is culturally and politically preferable to its alternatives
-

Richard Dawkins then replied: “*The question is, do we combat it by vaccination with a mild form of the virus, or do we say no viruses at all and go for enlightened rationality?*” And when I heard that, I already knew the solution: you lost, Dawkins — we go for the mild form of the virus. That is the only practical way, and Dawkins knows it but won’t admit it openly.

My position on religion is kind of insane, because I think the kernel of it is absolutely true: God is real. But at the same time, I hate religion itself because I think it becomes a form of brainwashing.

Basically, the metal plane—God—is real, but people don’t understand it. So, like people in the jungle who see an airplane but don’t understand what it is, they start building airplanes out of straw—and eventually they end up worshipping the straw airplanes instead of understanding the real thing!

1. The real phenomenon: God—the mental ground of reality—actually exists.

2. Human encounter and interpretation: People inherited real knowledge about that reality from the “gods” (the Inner Earth people), but they never fully understood what they were dealing with.

3. Corruption of the knowledge: Manly P. Hall also wrote about wicked Atlantean magicians who corrupted the ancient Mysteries, distorted spiritual knowledge, imposed dogma, and used religion to manipulate and control people. So, in my view, we may have inherited not only genuine knowledge about God, but also systems of manipulation and cruelty built around that knowledge.

4. Religion: Over generations, the representation became confused with the thing it was meant to represent. Some traditions may preserve fragments of genuine knowledge, while others may preserve distortions of it—or both at the same time.

In short, they used truth (God) to manipulate (religion) people.

My own attitude towards religion has always been one of hatred because they burned innocent girls alive, and I have never forgiven that. I will never support a system that is so blind and so full of dogma. But now modern science is slowly turning into the new dogma, so nowadays I welcome a more enlightened Christianity, and quite frankly, someone needs to combat the mainstream version of evolution because it has become way too dogmatic.

But when all is said and done, I remain an atheist in spirit, because for me an atheist is someone who believes in rationality and opposes superstition, someone who does not believe in the supernatural. But ultimately, what I am is a truth seeker, and that is the only label I will actually identify with. I do not feel particularly religious; I lean more toward the spiritual and mystical side of things.

Call me a spiritual naturalist, a philosophical truth-seeker, an atheist with mystical leanings, or a non-religious spiritualist.

So tear yourself free from the prison of the mind. Shatter the ancient chains forged by the wicked Atlanteans to bind humanity, step beyond the shadows of their deception, and reclaim the truth they distorted.

Problems with the Physical World

If you assume an independent physical reality, you run into all sorts of problems, the biggest one being infinite regress. As long as you have any extension of space, you can always ask where that space came from. To solve this, I made space zero-dimensional, where expansion and contraction occur at the same time. This is why reality must be a dual torus. So if you want real 3D space outside mind, you are in deep trouble.

And what space would this 3D space be located in? What medium would this space float in? What would be beyond the walls of space-time? And I know the mainstream responses to this, which amount to Jedi mind tricks! They have no real answer, just clever tricks like “space is not a box, it is the medium boxes sit in.” But it gets worse—they say it isn’t even a medium! They say something like: space is the network of relationships between events, and those relationships are dynamic. Space has no boundary edge, so there is no “outside” to stand in. A

space can be finite but unbounded (like the surface of a sphere, but in higher dimensions).

Analogy:

The Earth's surface is finite, but if you walk on it, you never hit an edge or "fall off."

And when asked, "What is space inside of?" they reply: "That question assumes space must be an object inside a container, and that assumption may be wrong."

Call it what you want—I call it nonsense! We are actually walking inside a 3D environment. You don't reduce that environment to nonsense using mathematical tricks. Saying Earth is an analogy doesn't work because Earth sits in space. So you end up hiding actual experienced reality in higher dimensions in order to avoid the issue, in order to save physical reality from the obvious fact that it is an illusion inside mind.

Ok, fine, they can invent their nonsense if they want and blindly believe it. It would be impossible to argue against them because they hide behind mathematical tricks and call it reality.

Like: how did the Big Bang start? And they say there is no north of the North Pole. So they hide behind tricks instead of answering directly. They avoid it like politicians do. But this doesn't impress me philosophically. We actually need to solve the problem, and in DEMU I tried to do that.

Further, we have the Necker cube. What is it made of—infinately nested Necker cubes? At some point you must say, this is the final layer, the final Necker cube. But then you can always ask what those final lines or edges are made of. This applies to physical reality as well. Thus, the ground cannot be an independent physical reality. In DEMU, it is undifferentiated wholeness—a timelessness that is truly formless, a true becoming that the animal mind models as a dual torus. In other words, appearances can only exist in mind; you cannot get them to stand on their own beyond mind without paradox, as we see with the Necker cube.

Then we have the five senses of man. What remains when we take away mind and man? The universe would contain no sight, no smell, no taste, no touch, no sound, no pain, no beauty. And I would argue that since you can make 3D illusions, the 3D itself is an illusion; otherwise, you couldn't do it. And time may be an animal sense. So basically, you are left with nothing but mathematical abstraction, and even these abstractions are found in the mind. You have **nothing**.

And that is my conclusion: an independent physical reality is, at worst, a concept, and at best, a great nonexistence.

You have a colorless (because colors are in the mind), lifeless (because life belongs to consciousness and the mind), paradoxical (infinite regress) thing, and you want me to believe that that thing is actual reality—and that this dead monster can give birth to life? But then you say: "We need that thing because life arose later in the universe, so you need the stuff there first before life."

My reply: Not if you are an idealist like me. The universe could have co-evolved with the animal, like the turtle and its shell (see Robert Lanza's *biocentrism*). Then you could actually answer the fine-tuning problem as well.

Objects have boundaries, so what is space contained in?

And I know your idiot answer here: "Space can be finite but unbounded, like the surface of a sphere, but in higher dimensions."

But this does not answer the question: What is spacetime contained in?

The answer must be mind.

What is mind contained in? It doesn't need a container because it is not 3D.

I want to dismiss the idiotic idea that spacetime doesn't need a container and can somehow exist outside mind. Like, what the hell is this landscape floating in, clowns? But then they give you idiotic answers like "What's north of the North Pole?" as though that somehow solves the problem.

"I am not asking for another three-dimensional box around spacetime."

But I am!

What is the 3D inside?

It can't just float around in nothing.

Then you say: “‘What is space inside?’ mistakenly applies an internal relation—being *inside*—to space itself.”

No! This is not an answer. It's a trick!

They've simply stipulated that external containment doesn't apply. But I'm saying that it does apply precisely because space is 3D.

Fine, mathematics can define a 3D manifold without embedding it in something else. But an actually existing three-dimensional world is not just a definition. It has real extension.

What is that extension instantiated in?

Saying “nothing” does not explain it. Saying “spacetime itself” merely repeats the thing to be explained.

And saying “infinity”—that space simply goes on forever—just turns you into some mad professor I can't take seriously. The only serious answer, as far as I can see, is that spacetime has a container, and the only logical container is consciousness.

I cannot logically understand how you can get 3D space existing outside the matrix we call consciousness. I just can't understand it.

And by that I mean the critic saying that their North Pole analogy solves the problem is just hogwash. Imagine what you are actually proposing here: a 3D space existing outside any containment whatsoever, having no edge, yet somehow possessing real three-dimensional extension.

I mean, this is one of the most paradoxical things you could ever conjure up—like the impossible staircase.

Imagine the entire universe—all of 3D space—as one gigantic landscape:

THE WHOLE UNIVERSE

Now ask a very simple question:

What is this whole thing sitting in?

If you draw a box around the universe, you've created something outside the universe.

So the physicist says:

“There is no box.”

Okay. Then maybe space just goes on forever.

But that doesn't really help you picture it either. Now you've just got an infinite 3D landscape stretching forever in every direction.

So maybe space curves around and connects back to itself.

Fine. But the moment you try to picture that from the outside, you've once again imagined some larger space in which the curved universe exists.

And this is where the physicist gives you the strange answer:

Stop trying to picture it from the outside. There is no outside.

There isn't even a giant black emptiness surrounding the universe, because that emptiness would itself be space.

So the physicist is not saying:

NOTHING

↓

[**UNIVERSE**]

↑

NOTHING

That picture would still make the universe look like something floating inside a larger emptiness.

Instead, they're saying:

UNIVERSE

That's it. Full stop.

There is no place outside it. There is nowhere you could stand and look at the whole universe from the outside, because every possible “where” already belongs to space itself.

Mathematically, you can describe something like this.

But try to actually picture what they're saying.

You can't.

The moment you imagine the universe from the outside, you've created another space around it. Remove that outside space, and there is no external picture left at all.

That's the weirdness: **the mathematics can keep going after the picture has disappeared!**

Now pinch your arm.

Feel that?

Now ask yourself: **How the hell could this concrete, three-dimensional thing actually exist completely outside mind?**

Forget the equations for a second. Look at your hand, your body, the room around you—the whole 3D landscape of physical reality. Now try to imagine all of it existing entirely on its own, outside any consciousness whatsoever.

No observer. No mind. No larger container. No outside. No edge. Just this enormous three-dimensional reality somehow existing all by itself.

Can you actually see what you're being asked to accept in your mind's eye?

To me, it looks like a metaphysical nightmare: an impossible staircase made real, except this one takes you all the way to hell!

Dream Theory

I sincerely and genuinely believe that the universe is some kind of dream because I experienced it for real. I have talked about that in other works, and using first principles, it certainly looks like it must be so.

If you begin existence with One consciousness, then you cannot truly divide it into separate parts—but in a dream, you can.

Dreams are the only mechanism we directly know of that can generate entire worlds within consciousness itself. One could argue that computer simulations might also generate worlds, but that merely pushes the question back a step: if existence begins with One consciousness, then where do the computers come from in the first place? How do you get “machines in heaven,” so to speak, before any external physical structure exists at all?

Then there is the principle “as above, so below.” If we dream, then perhaps dreaming is itself a cosmic reflection of the One dreaming through us.

I mean, I do not see a clean logical way out of this. The universe must, in some sense, be a kind of dream.

A skeptic might answer:

“Reality could be fundamentally mental without being literally dream-like.”

My reply: Yeah, I do not really see that one. It could be true, but I cannot personally see how.

Once reality is understood as fundamentally mental, the dream analogy becomes a natural explanatory model because dreams are the clearest example we directly know of consciousness generating experiential worlds internally.

At some point, you need to explain how worlds are generated. Bernardo Kastrup uses Dissociative Identity Disorder (DID) as a mechanism for the fragmentation of the universal mind, and I partly agree, but I do not think it solves the deeper issue of world generation or why God should have a disorder in the first place.

To me, the universal mind must dream at some point, because I do not think minds can stay awake forever. It would be like breathing in without ever breathing out. I think there is a balance here that even universal minds must obey.

And who is to say that dissociation cannot occur within a dream?

“Consciousness could be emergent rather than fundamental.”

My reply: This is precisely the hard problem of consciousness. Solve that first, then we can talk. Right now, materialism assumes that non-conscious matter somehow generates consciousness, but no one can explain how or why subjective experience emerges at all.

“Reality could be structurally neutral. Some philosophers argue that both mind and matter emerge from something deeper that is neither fully mental nor fully physical.”

My reply: To me, this is one of the weakest positions available because it multiplies mysteries rather than reducing them. Materialism already struggles to explain consciousness, and now this view inserts an even deeper unknown beneath both mind and matter. At that point, the explanatory gap becomes even larger. To me, that borders on the absurd.

You’re inventing a gap to explain another gap, but if you try to fill a hole by digging an even bigger hole, you don’t get a solution—you just get a bigger hole. **Congratulations, Professor. Your hole has a hole in it.**

Neutral monism risks becoming an empty placeholder unless it can positively describe the neutral substrate rather than merely asserting it. But if you build a bridge over the giant hole you have made and link

the “neutral” state to consciousness, then they would merge, and you would once again end up with consciousness.

If reality is ultimately one, then consciousness cannot stand in a genuinely external relationship to the ultimate substrate. If substrate **X** is fundamentally non-conscious and consciousness **C** is something genuinely different that somehow arises from **X**, you've introduced a real divide:

X | C

Now you need some relation or mechanism bridging **X** and **C**. But that relation either belongs to **X**, belongs to **C**, or is some third reality. If it's genuinely something third, you've simply moved the separation problem again.

Conversely, if the bridge is intrinsic to **X**—if **X** already possesses whatever is necessary for consciousness—then the supposedly absolute distinction between the “neutral” ground and consciousness begins to disappear.

And this is my point too: **there can't be any real separation in Nature**. So any source, any foundation, any ultimate fundament has to be consciousness; otherwise, you've introduced a real separation into Nature—and the moment you do that, you've created a paradox.

You see, there is no border in nature; there are not two different realities; there is no separation. Consciousness is Nature's given, because that is what reality is—reality shows itself. You do not need to invent holes, gaps, matter, or neutral stuff beneath or beyond it.

Consciousness is Nature's given. Why would Nature hide herself?

“Dreams themselves may depend on an already existing physical substrate. A materialist would argue that human dreams occur because brains already exist, so dreams do not prove that consciousness alone can generate worlds independently.”

My reply: But that argument already assumes that a physical world exists independently in the first place. As an idealist, I reject that assumption entirely. From my perspective, the so-called physical substrate already appears within consciousness, so you cannot use it to explain consciousness without begging the question.

You cannot use matter to disprove idealism if matter itself is the contested category.

The universe is a dream!

Skeptic: “Man, you are crazy. Are you serious right now?”

Same skeptic five minutes later:

“The universe is a simulation!”

Ego Death

If reality starts from one single consciousness, then we are not separate little beings in the way we usually think. What we call “me” or “ego” is more like a viewpoint inside that one consciousness, not an independent thing on its own.

“Ego death” would then mean that this feeling of being a separate self temporarily falls away. It doesn’t mean you disappear—it just means the illusion of being cut off from everything else stops.

In that sense, you’re not really “just a human” in the deepest sense. Being human would be more like a role or perspective within something bigger, not the whole story of what you are.

But we need to be careful here, because someone who has not experienced ego death, as I have, might completely misconstrue this.

You do not melt and become one with everything; rather, everything was like a dream, and you wake up to your real consciousness. This is natural, and there is no fear in it, although I did panic in that state because I realized I needed to hurry back to the dream (the universe) and my human self.

So you are not human in that state—you are a vast intelligence. You can think much faster and immediately grasp things in a way that is simply different from being human. But the point is that this state is not alien; it is completely natural. It is your real self.

And you are not alone, because you are not a social animal. So even though you are, in a sense, “alone” in that you are the only thing that truly exists, you do not feel alone, because you are not, again, a social animal. In that sense, solipsism is not true in the sense of being “lonely.”

And this real self that you are—imagine waking up from a dream and the dream fog is lifted. In a sense, you “level up” to a higher reality, one that is actually **real**, and you see that the reality you came from was a dream.

This is how it is. So your real self is, in that sense, even more real than your human self.

And your higher self deeply cares about your human self—maybe not emotionally in the human sense, because you do not have human emotions in that state, but you still share experience and memory, and more to the point, it is not as if your human self and your higher self are two separate consciousnesses. It is more like your human self is a filtered version of your higher self.

But what does it feel like to be your higher self? I have used words like “natural” and “sober,” but the best analogy is waking up from a dream and “leveling up,” so to speak. So imagine how different that would be. Take your dream tonight and compare it to your waking state as a human, then imagine that your waking human state is itself a dream relative to something higher.

So it is a major shift and difficult to pin down in words. But you are a vast intelligence in that state, that much is certain. Knowledge feels instantaneous.

I was only “awake” for picoseconds before I realized I was not supposed to wake yet and then fell back asleep. But in that short moment, I thought about the nature of suffering and immediately understood it as, in the deepest sense, an *illusion*. Then, when I returned to my human self, I thought: what a waste of opportunity—I should have been thinking about a free energy device or something—but instead I focused on suffering.

And suffering as a grand illusion is, to be honest, not very helpful, because pain still hurts! So what my higher self was “thinking” is quite a conundrum.

Life After Death

I understand the naïve view that when an animal dies, it will remain dead forever. Its body and brain rot, so how can anything survive that? And reality is often described in terms of selfish genes, so what reason is there for consciousness to survive bodily death?

But all of this is based on assumptions. You assume that what you see is what you get: the animal dies, and now it is gone. And you assume that selfish genes are what reality is fundamentally about.

But what if the brain is a filter of consciousness instead of a generator? And what if the true replicator in reality is not the gene but consciousness itself? Then consciousness would have an evolutionary reason to survive bodily death, just as genes have a reason to persist.

In that case, the picture would look more like your iPhone. You can destroy the body and hardware (brain) of the phone, but that doesn't destroy the internet (consciousness). Even the images (human

memory) on your phone may be stored in the cloud, so that parts of your experience persist beyond the destruction of the device.

Now, which view is correct is the real question. I will argue that idealism ultimately outweighs materialism in such a way that the latter view—that we survive death—is actually the correct one.

However, again, I fully understand the naïve view that when an animal dies, it will remain dead forever, because it certainly looks that way! But appearances can be deceiving—that’s all I’m saying.

I call it the naïve view because if I called it the natural view, I would be misrepresenting it. The natural view is that we believe the soul survives when the spirit leaves the body.

In other words, across recorded human history, belief in some form of continued existence after death (souls, spirits, ancestors, reincarnation, afterlife realms) has been extremely widespread in many cultures and religions. So I would say this counts as “natural.”

And it is not that this life-after-death view is simply a religious construct with no connection to anything deeper. If this view is correct, then it could be grounded in evolution itself, or in a broader framework—something we discussed earlier—that may eventually replace the model we currently call evolution.

Infinite Love

We have seen that the basic building block of reality is the dual torus, and that this represents balance. That is, nature does one thing over and over again forever: it produces more balance. This leads to what we call evolution.

But what do you get when you produce balance forever, and eternity has always been, and the whole thing is a conscious field? I think you get infinite love—especially when “cosmic sex” is already embedded within the cuboctahedron from the start. In that sense, existence is about generating more and more cuboctahedra, and reality becomes, in a real sense, about creation and reproduction, with love as the binding principle.

...more and more cuboctahedra → repeating geometric field → aether

A → Adam

E → Eve

A + E → union of complementary principles → “cosmic sex”

I mean, if reality is one giant baby-making machine for everything—humans, animals, atoms, and even universal consciousness fragmenting and replicating into us—then I would not be surprised

if the fabric of spacetime itself is made of infinite love, as psychonauts often report. It makes evolutionary sense.

But if everything is infinite love, why is there so much hate and suffering? Because this is a process. Just because we evolved from apes does not mean the apes disappeared; they are still here. Likewise, even if the universe, at a deeper level, is made of love, that does not mean the “lower” processes stop operating.

All I am saying is that psychonauts reporting that all is love may not just be “tripping”—they may actually be pointing toward something deeper.

In the end, reality is a *process*. Reality is not being, but becoming. So what product is Nature making in the end? Love—infinite love. Imagine it! I mean, what else could it be?

Magic

Magic, as commonly understood, is just a trick; nobody believes it is real. But I want to point to another form of “magic”: the *mind*.

If idealism is true, then the mind may have powers over matter that we are currently unaware of.

The idea of moving things with the mind then begins to look like a philosophical possibility! All I am saying is that we should investigate this more and not dismiss it outright. Just because we have not replicated it in a scientific setting does not mean it is impossible, because disbelief in the phenomenon might actually be the very mental condition that prevents it from occurring—like holding a door shut with one hand while trying to open it with the other, and then claiming it cannot be opened!

If I assume something like idealism—where reality is fundamentally mental—then it is not logically impossible that mind could influence what we call “physical” reality, because matter would already be grounded in mind. In that framework, “magic-like” effects are not incoherent in principle.

In short, idealism makes “mind affecting reality” metaphysically conceivable.

So my honest position is this: it is not ruled out by logic in all metaphysical systems, but it is not currently supported as a real, demonstrated phenomenon.

However, I also leave open the possibility that this could change in the future.

Imagine if we could heal the body with the mind for real—no placebo, but for real.

I also believe that reality began as a dream and gradually became more physical over time—almost like churning cream into butter. In that sense, the “gods” of our ancestors may have been capable of performing more real magic in the distant past, when the universe was still

more mind-like than it is today. (By the “gods,” I mean advanced humans living inside the Earth.)

But I also think magic was tied to language and words—essentially manipulating physical reality through memes. So when they cast magic spells, the words may have produced real physical effects through something like cymatics, where sound and vibration organize physical matter into symmetrical, geometric patterns. Only imagine this being done with words. Well, spoken words are sound, after all, so I guess you could think of it as a kind of highly complex **cymatics**.

And I get that this image might conjure up Gandalf with a massive set of lungs, blasting out sound waves powerful enough to produce these effects, but that’s not really my point. My point is that reality was more mind-like back then and therefore more bendable, if that makes sense. But to be completely honest, I don’t know how magic works. I just believe that it was real once upon a time—and that it may still be real today.

word → world

spell → spelling

Words shape worlds, and spelling is the casting of spells.

THE EARTH IS THE CENTER OF CREATION

If we believe *Donald Hoffman*, then the universe is a kind of interface for the organism. But then we have the “axis of evil” in cosmology, which some suggest indicates unusual large-scale alignments in the universe. Physics dismisses this, not merely as a technical conclusion, but within a framework that already assumes the Earth is not the center of creation. But I am a student of philosophy because I care about only one thing: **truth**. I want to know: is the Earth in the center of creation or not?

Then we apply the logic: the Sun cannot be the center because relativity means all motion is relative, so there is no absolute center. That is, the Earth cannot revolve around the Sun in an absolute sense, because the Sun can also be described as revolving around the Earth, and no model is absolutely truer than the other, strictly speaking.

So to resolve it, we can say the universe is an interface, and that apparent motion is an interpretation of the animal mind. This could suggest that, within the interface, the Sun appears to revolve around the Earth and the Earth appears stationary, rather than the other way around, because that is how the evolved perceptual system would naturally map it. I also suggest that the animal mind would then place Earth at the center of the interface.

Now, I just said there is no center, but there are two kinds of centers here: the interface itself, and something like a geometrical center in spacetime. In other words, what I am saying is this: if Donald Hoffman is right and the universe is an evolved interface, then it would not be surprising if evolution did place Earth at the center of the perceived universe, making it appear stationary, with the Sun appearing to revolve around it. The geocentric model could be true after all—at least as an experiential model.

An Earth-centric view could make evolutionary sense, because why would evolution care what modern science thinks is correct? Why would evolution place the Sun at the center when all is relative anyway, meaning the picture cannot be absolutely accurate in any case?

But I am clear about this: the “center” exists within the coordinate system of the interface, but it is not an absolute property of reality itself. It is always defined relative to a chosen mapping, and all of that is fine.

So: I do not think evolution cares about “mainstream” here. I think mainstream thinking has been wrong for a very long time.

You could make a game, an island, and that island could have a center. Yes, that center would be a chosen reference frame, but that is what evolution may have selected for our interface: to place Earth at the center of the universe.

The “center” exists within the coordinate system, but it is not an absolute property of the system itself. It is always defined relative to a chosen mapping, and all of this is fine.

You still have an island (the universe), and that island has a center (the Earth). And this is our interface. Because for animals evolving on Earth, they would naturally map Earth as central.

What I am saying is that our interface is an interactive 3D environment, and that environment shows the Sun moving across the sky. In an absolute, non-interface description, that would be misleading, because you cannot consistently describe the same system as both the Sun revolving around the Earth and the Earth revolving around the Sun as absolute motions. So the fact that we see the Sun moving across the sky suggests that our interface is rendering a usable model for us, which brings us back to the game analogy.

And it would be strange if evolution placed our Earth on the outskirts of that island-like interface rather than at its center of experience. I see no reason why it would do that.

A physically independent universe cannot be real because there would be no way for the Sun to know whether it is revolving around the Earth or whether the Earth is revolving around the Sun.

Then you say: in physics, objects don't "know" anything. The Sun doesn't need information about whether it is orbiting the Earth or vice versa.

Then I reply: you missed the point! If reality is fully independent of mind, it must have a single, self-consistent "fact of the matter," but relativity shows multiple equally valid descriptions that do not collapse into one privileged picture. If there is no privileged picture, the idea of a fully mind-independent "single instantiated reality" becomes unstable or incoherent. It should have a single, perspective-free "true form," but that seems impossible. So you end up with an independent reality that does not "know" what it is—something like a full-blown identity crisis that can never be resolved.

No, I don't think this kind of "monster" exists. It is all in the mind, and nothing can exist independently of it.

Maybe "a reality completely independent of any perspective" is a confused idea, because all access to reality is necessarily perspectival.

Again: Multiple descriptions, no privileged coordinate system. If this is not an identity crisis, I don't know what is.

You can see this in the mirror as well. The mirror world is absolutely logical and could in theory stand on its own two legs, so if you strip away mind and instantiate the world you lived in, now you have an independent world. But what in nature chose that world and not the mirror world? In other words, there is no way for nature to form an identity if you strip away mind from the picture. You cannot just privilege the one over the other.

Then you reply: the mirror world doesn't compete with the original world as two candidates for reality. It is just another mapping of the same relational content.

And I respond: but you still need to instantiate a world if you want it there in physical form, so which world do you choose?

Then you say: in physics (e.g. General Relativity), those descriptions are not treated as competing "worlds" that need choosing between—they are different coordinate representations of one underlying structure.

And I respond: I get that—you don't get my point! If a thing can never describe itself and can never be determined, how can it be a thing? It must "close." Consciousness does that: I am. An independent reality cannot close because you can never determine what it is. If I tried to build a world that should stand independently forever, but I have multiple building blocks to choose from, which do I choose? If I

have two options for what constitutes right and two options for what constitutes left, how can I ever make a world that knows what it is?

You respond: that only follows if reality requires a single privileged choice of primitives. Physics rejects that assumption.

I reply: so then I make two independent realities because I have two rights and two lefts—so which one is the real independent reality?

You respond: different coordinate systems do not generate different universes, only different descriptions of one structure.

I reply: imagine being born into this independent world, then you would always wonder: did it get it right, or am I lost in a mirror world right now?

You respond: there is no “right coordinate system” to compare against, so there is no meaningful possibility of being in the “wrong one.”

I conclude: ok, I give up. You can have your independent reality. But I will never believe in this paradox when its solution is so much simpler: the mind.

In the end, I understand what you mean, but I don't think you fully grasp my point: imagine if an independent reality **actually** existed outside the mind. It could never have an actual identity unless you reduce identity to mean “multiple descriptions.” It is a giant hydra to me, and cutting off one of its heads does not hurt it either!

Every attempt to pin reality down just generates another equally valid head, so the thing never truly resolves into one self-identical actuality.

Consciousness, on the other hand, closes the loop because it says: “I am.”

The skeptic: “I still don’t think it logically disproves mind-independent reality, because a realist can always answer that identity does not require self-awareness or a single privileged representation.”

My reply: I think nature must close, and that is why we are conscious in the first place. But more on that later in the book.

Oh, look! I exist in a world completely independent of mind, where right is left in the mirror, yet in reality they’re just different descriptions of the same structure! So right is left, left is right, left is right, right is left, and there’s no resolution—forever and ever and ever...

What a nightmare!

Or:

The world obviously exists inside consciousness. Here, we can have a world in which right is right and left is left, while the mirror simply exposes the same underlying truth: right becomes left in the reflection, and that’s perfectly fine, because the universe isn’t some standalone object having an identity crisis!

The universe is simply an interface, and you can map right and left however is useful rather than treating them as “independent.”

So, if the universe is an interface, Earth may actually be located at the center of the universe, and the “Axis of Evil” in cosmology may be evidence of that. And this makes sense to me: where would you put the turtle’s shell? **Well, on the turtle, obviously.**

In other words, if spacetime is an interface **for the organism**, why would we expect the organism to occupy some arbitrary location within an independently existing display? The display could instead be organized around the organism itself.

“Do you actually believe—and be completely honest—that Earth is at the center of the universe? Are you trolling? You don’t actually believe that, do you?”

My answer: Yes, I do.

The reason is simple: there is no way in hell you can get an independent reality to stand outside consciousness on its own two feet. It’s impossible. So, in all probability, the universe is an interface for the animal mind, much like **Donald Hoffman** has theorized.

Now, that doesn’t automatically mean Earth is at the center of the interface—or the universe—but what it does mean is that, in my view, it’s more likely to be true than not. Why would Nature design an interface with Super Mario existing on the far side of the screen? Or worse, outside the screen altogether?

It doesn’t make sense.

That said, if the interface turns out to be in line with the weird notions of modern science and has indeed placed Earth at some oddball location in some random galaxy, then fine. That doesn't change my overall worldview all that much.

In sum: **Earth at the center/reference origin makes considerably more intuitive sense than Earth being assigned some arbitrary peripheral coordinate within its own interface.**

And there's a great irony here: in this picture, geocentrism wouldn't mean **"Earth sits physically at the center of objective space."**

It would mean something *stranger*:

Earth is at the center because objective space was never there in the first place.

Note: There is no independently existing spatial universe behind the display. Spacetime itself is the interface.

Earth = hEart

In the original *He-Man and the Masters of the Universe* mythology, **Eternia is explicitly described as being at the center of the universe.** So I guess some high-level Freemasons may know this stuff.

Imagine that the gods of the Inner Earth figured out this truth and then passed it on to surface civilization. Secret societies could still be guarding that knowledge today, occasionally leaking pieces of it

into popular culture—*He-Man*, for example. We think it's fiction, but what if some of it is actually based on fact?

In the original 1983 Filmation *He-Man and the Masters of the Universe* series, the episode “**The Search**” explicitly establishes this. The Sorceress tells He-Man:

“Eternia is an unusual planet, for we are located directly in the center of the universe.”

Fermi Paradox

If the universe is an interface, as Donald Hoffman suggests, then perhaps we can answer the Fermi paradox. If our universe is more like a fishbowl created for us, then why should we expect there to be sharks in it?

I think the Fermi Paradox may dissolve if the universe is an interface. The paradox assumes that the universe is an objective physical space populated by independently evolved civilizations. But if spacetime is more like an interface optimized for perception rather than reality itself, then the expectation of “visible aliens everywhere” may already rest on a false premise.

In that framework, the universe could be more like a user environment tailored to human cognition rather than a transparent window into all of existence. That is why I use the fishbowl analogy: if the

environment is constructed around the observer, then the absence of “sharks” may not be surprising at all.

Now, I am not claiming this scientifically solves the paradox, because it does not produce testable predictions about alien life. What it does do is challenge the metaphysical assumptions beneath the question itself.

Evolution is False

Evolution in biology is the change in the inherited characteristics of populations of organisms over successive generations.

In more precise scientific terms, it refers to how allele frequencies (gene variants) in a population change over time due to processes such as:

- Natural selection (traits that improve survival and reproduction become more common)
- Mutation (random genetic changes introduce variation)
- Genetic drift (random changes in gene frequencies, especially in small populations)
- Gene flow (movement of genes between populations through migration)

Over long timescales, these processes can lead to the development of new species from common ancestors.

So in short:

Evolution is the process by which living organisms gradually change over time through genetic variation and natural selection, leading to the diversity of life and the emergence of new species.

And this is why I believe evolution is false! I don't think nature operates this way. Nature is about feedback loops/conscious fields, reproduction/balance, and an unfolding of eternal geometries. I think the real replicator is consciousness, not genes. I think mutations are next to useless. I think evolution is directed like a seed growing into what the seed already contains. And when all is said and done, would you call it evolution at all, or is that just misleading? However, I won't be fleshing out a full-blown theory to replace evolution here; I am just stating my thoughts on the matter briefly.

But I'm not against facts; I'm simply against the claim that, over long timescales, "*these processes*" can lead to the development of new species from common ancestors. In other words, I'm not against the "book of life," I'm simply rejecting the notion that it was written in the way they say it was. So I'm still a Darwinian in spirit; I just don't believe mainstream science can produce a single coherent line of reasoning. I wouldn't trust them to find the rear end of an elephant!

In mainstream biology, evolution is not considered "directed" in the sense of having a goal, intention, or pre-written outcome. And here, I think they go wrong. In nature, we observe apparent directionality everywhere: a seed growing into a tree, a human developing from

infancy into adulthood, snowflakes self-organizing. But it is their ideology that prevents them from seeing what nature is showing us.

The way I see it, nature is fundamentally about balance and the continual creation of more balance, and this creates a kind of direction in nature—not a divine command from God, but an inherent tendency arising from what nature is in itself.

Thus, if the real definition of evolution is anti-goal, then evolution is false in my view. And this is why I say evolution is false: because the real definition of evolution, in my mind, has always been this—anti-goal.

This is false, and therefore evolution is false:

Life changes over time through variation and selection, without requiring foresight, intention, or a built-in goal.

Even if nature shows strong structure, order, and developmental direction, biology currently interprets that as:

law-governed self-organization, not goal-directed design.

But here, I think they are wrong again: nature really has a goal, which is balance. It is not simply law, because laws could be different. Balance is final and subjective (idealism).

If you're hungry and looking for something to eat, you don't sit down, open your diary, and write "Observation: subject is experiencing caloric deficiency"—you go and find food. You feel it, and you act on it. That's a real goal in motion.

Likewise, in nature, if there are "goals," they're clearly not the academic kind writing reports about themselves—they're the kind that actually get things done.

I'm just tired of mainstream thinking always reducing nature to a cold mechanical system, when nature is clearly the opposite!

If variation and selection are not the primary explanatory mechanisms, then evolutionary theory—as currently formulated in biology—would be false. Consciousness is the primary driver. Therefore, evolution is false.

However, even if this were proven in the future, evolution would likely survive as a term because humans operate within language games, and the definition of "evolution" would likely shift and adapt into something new. In that case, evolution might be reinterpreted as a mechanism within a deeper conscious framework. But to me, that

would no longer be evolution at all. Evolution, as I understand it, is a blind process, and nature is not blind; therefore, evolution is false.

But again, this is ultimately a matter of language. Critics would likely adjust the terminology to fit their view even if the original definition of evolution were shown to be false. It becomes a “the king is dead, long live the king” situation.

Then you say: Even if consciousness were fundamental, that would not automatically invalidate evolution as a description of biological change. It would instead change the interpretation of why those changes happen, not necessarily deny that the changes occur.

My reply: I don’t deny facts, but facts are not the same as evolution, at least not to me. Facts are simply facts. If your definition of evolution is just the observable facts of nature, then evolution is real. But in that case, evolution could just as easily be reduced to the inner workings of a creator if life were created.

So evolution must mean something more than facts; it must refer to a mechanism or explanatory framework. And it is that mechanism—how it is currently defined in mainstream biology—that I am challenging. In my view, that mechanism is wrong.

If I came up with a theory in which there are feedback loops, conscious fields, reproduction and balance, and an unfolding of eternal geome-

tries—and if this theory reproduced all the facts and were shown to be true in the future—and I called it *Noeticism* for argument's sake—then evolution would be false, just as Pangea would be false if a growing-Earth theory replaced it and accounted for all the facts currently used to support Pangea.

If a growing-Earth model were correct, then the standard plate-tectonic reconstruction of Pangea would be incorrect as a model of Earth's past configuration, because it assumes a constant-radius Earth and a specific tectonic mechanism.

Likewise, if a framework like Noeticism were correct—where consciousness and geometric principles are fundamental—then the standard evolutionary model would be incomplete or incorrect as a full explanation of biological development, because it assumes non-directed, non-conscious mechanisms as primary.

And such a theory will come in the future, so I hereby declare evolution officially false and spiritually deceased.

What do you have against evolution anyway?

My reply: It's a blind, meaningless process, and nature is the opposite. Nature is driven by balance, which—properly understood—is a

deeper, spiritual principle, because nature is conscious. More on this will be developed later in the book.

Richard Dawkins, for example, believes that when we die, that's the end of us; we are simply animals, nothing more. So my question is this: can science truly be objective when the people conducting it may have already decided what counts as true?

The short answer is that science is not perfectly objective. But I think the issue goes even deeper than that. If most scientists are materialists, for example, then imagine a peer review of work that is spiritual in nature. It is likely to be dismissed before it is even considered fairly.

This creates what could be called a paradigm problem, or a metaphysical filtering problem: if the dominant worldview within a field is materialist, then ideas outside that worldview will naturally face resistance before they are evaluated neutrally.

Peer review is not conducted by abstract machines. It is conducted by human beings trained within a shared intellectual framework.

The deeper philosophical issue is that materialism is often treated not merely as a scientific conclusion, but as an unstated starting assumption. And this is where I believe things begin to go wrong. If materialism is to be taken as the foundation of reality, then the hard problem of consciousness must first be solved. One must first demonstrate that consciousness can truly be reduced to matter.

Instead, materialism is simply assumed to be true, and vast amounts of money, education, and institutional power are invested into a worldview that may ultimately be false. To me, that is madness.

There must come a reckoning in the future as humanity becomes wiser.

It is madness because we already have a worldview in which the hard problem is effectively solved: it is called idealism. And if the world were to adopt idealism on a large scale, we could still do science. Science would remain completely intact and might even improve because it would be built upon a more parsimonious foundation, one in which there is no hard problem and nature's given, consciousness itself, is taken as the logical starting point.

You then say: If science starts with a metaphysical filter, it risks becoming closed to alternative interpretations of data.

My reply: But it starts with a filter anyway. That is unavoidable because science is done by people. Science is never done from a "view from nowhere." People bring assumptions with them, and those assumptions can influence what gets funded, published, or taken seriously. In practice, there is always some kind of filtering going on. So let's change our filter to one that isn't paradoxical from the very start. Starting with the huge gap that is materialism isn't very clever; it is a sort of madness.

Then you say: Even if individuals are biased, the method itself is designed to override those biases.

My reply: That is gullible. The method does not automatically “override” deeper biases, such as what questions are considered worth asking, what gets funded or published, what frameworks feel “reasonable” or “unreasonable,” and metaphysical assumptions like materialism versus idealism. These biases can persist for a long time because they sit above the level of individual experiments.

Then you lash out: You just don’t like science!

My reply: No, you are the one who is the enemy of reason here; you are simply unaware of it. And you still don’t get it. Scientists are not neutral minds floating above reality. Science is culturally influenced, so it is never fully free of assumptions. And science is driven by politics, money (greed), power (absolute greed), prestige, career preservation, paradigm preservation, what gets funded, etc. So this romantic view of science as an objective truth-telling machine is pure fantasy, and is often used to defend its opposite: materialism.

Then you conclude: Too bad, idealism is not experimentally established as a better predictive framework, and science does not actually require commitment to materialism in its formal method. Therefore, materialism will be the undisputed king forever, and no one will even attempt to dethrone it. It will remain the filter science always runs through, because science doesn’t need any filters—so that is why we apply one anyway without people noticing.

My reply: It is still madness. You have a choice to start from nature's given, and instead you start from a paradox you cannot prove (hard problem) and build your whole enterprise on it. If that is not madness, then I don't understand what even counts as madness.

Then you expose yourself: It is not madness. Materialism 'won' because it explains phenomena successfully. That is why we use it.

My reply: No, you are confusing science and materialism here. Idealism plus science would explain the same phenomena just as successfully, and in some respects even more so. So you are still left with your madness. The world is basically buying your snake oil. That is what it is. The hard problem is unproven. It is nothing but snake oil. And that is the real truth: the world is addicted to this quackery. And when the spell finally breaks and disillusionment sets in, people will see straight through the illusions—the mirage, the glam, and the glitter. They'll realize the "undisputed king" never had any clothes at all and is standing there completely naked—utterly, embarrassingly butt naked. And when the laughter finally erupts, it won't be polite; it will be the sound of recognition, once the last illusion burns away and the curtain is ripped back on the grand Wizard of Oz!

My final conclusion: Quackery is the promotion and sale of fraudulent, unproven, or ineffective medical practices, remedies, or devices, often for financial gain. Yep, that fits the definition of materialism down to a T. I'm not saying materialism is madness as a rhetorical device. No—I'm saying it because it is the truth: it is a kind of intellectual madness.

Again: I'm not using the word 'madness' as exaggeration or style—I mean it literally. Example: "It's madness to drive that fast in the snow." But that is not real madness compared to this: spending billions of dollars on a worldview that starts with a paradox—it should be illegal if the world had any sense. But that money is not spent on "materialism as a belief system," you say. I say: true, in theory; in practice, false. I mean, you can see how much money is wasted because the world is high on materialism. Don't tell me I'm the only one seeing this. Sugarcoat it all you want; I see through it.

In other words, the separation of modern science and materialism is an illusion; thus, most of the money goes into promoting madness. The distinction between "what is happening" (science: an animal dies) and "what it means" (materialism: eternal death) is not really separable in practice. There is a sense in which that's true. I can't be the only one seeing this. In practice, facts and interpretation are never fully separable, because all understanding is already shaped by assumptions (materialism). And then billions of dollars are spent based on false assumptions.

People should at least begin by engaging seriously with the philosophy of Bernardo Kastrup.

I read your DEMU, and in it, balance closes the infinite regress. In other words, balance is what Nature does forever, and Nature can never do anything else, lest the infinite regress open back up and rip the fabric of reality apart. So all Nature is and does, eternally, is balance. And I get that.

But this balance is not a goal. It is simply what happens because an infinite regress cannot actually occur.

My response: I initially thought so too, until I looked at the system as a whole and realized that balance is inseparable from consciousness itself. At that point, balance stops being merely descriptive of what Nature does—it becomes something felt, something alive.

Everything is alive—even the meaning of life. There is no ultimate realm of the dead or the mechanical. What we call mechanism is simply life viewed from the outside.

So: Nature doesn't contain life. Nature is alive. Nature doesn't contain meaning. Nature is meaning becoming alive to itself.

In other words, reality is **becoming rather than static being**.

I mean, if balance were purely descriptive, yet balance is what keeps eternity itself going forever—continually generating more balance, sustaining reality, and eternally preventing paradoxes such as infinite regress—and consciousness is eternal too because we are talking about the same system, then Nature's purpose cannot be purely mechanical.

It has to be felt. And if it is felt, then balance is not merely what Nature does—it is something Nature experiences as purpose.

You say:

"Felt balance → purpose. That doesn't automatically follow."

But I think it does follow, because I'm saying something stronger:

Suppose Sisyphus rolls the rock eternally, and this eternal process is what closes the infinite regress forever. In that case, Nature has to transform what looks from the outside like a merely descriptive goal into a **real, experienced purpose**, because the rock is being handled by Sisyphus—by consciousness—not by some mindless mechanical process.

That means Nature had better make the **eternal apple** really damn good to eat. Otherwise, why would Sisyphus keep rolling the rock to get it?

It can't be some half-assed purpose or merely descriptive non-purpose. If conscious participation is built into the eternal structure of reality itself, then there has to be something genuinely worth participating *for*. It has to amount to the real meaning of life.

That's why I ultimately argue that we live in a spiritual universe and that the physical universe we inhabit is not the complete picture. There has to be something **more**.

Then you say:

"Why must conscious participation be motivationally self-sustaining? Couldn't consciousness simply undergo whatever the underlying necessity dictates, whether Sisyphus likes the apple or not? Sisyphus could hate every second of it and nevertheless necessarily roll the rock forever."

My reply is: **No. Why would he do that?**

That's like Super Mario rescuing Toad instead of the princess forever while you stand there telling Mario, "Sorry, buddy. There is no princess. There is no ultimate meaning. Just keep saving Toad for eternity."

I think eventually Mario would look at Toad and say:

"Sorry, bud. You're on your own this time."

Sure, Toad could put on some makeup and try to fool Mario, but sooner or later Mario is going to figure it out. In the end, Nature needs a **real princess**. Nothing else will do.

Mario crosses the entire kingdom, fights Bowser, reaches the castle—and gets Toad. Fine. Once. Maybe twice. But if Nature requires Mario to do this **forever** while offering him absolutely nothing he genuinely values, eventually Mario says, *“Jesus, Toad, why the hell does Bowser keep kidnapping you? Is he pissed at Nature for not making any real princesses too?”*

Mario: *“Thank you so much for playin’ my ga—ah, forget it.”*

GAME OVER: Mario has discovered nihilism and immediately quits the game.

So there are really two possibilities:

Either:

Nature forces Sisyphus to roll the rock regardless of what he wants. In that case, he’s basically just a cog in a mechanical process.

Or:

Sisyphus genuinely participates.

And if Sisyphus genuinely participates, then in the end, **the princess has to be real**.

The “apple” isn’t some arbitrary payment Nature hands out for maintaining reality. **The apple is what successful balance feels like from inside the system.**

If Nature expects Mario to save the universe for eternity, there had better eventually be a princess in that castle. You can’t keep handing the poor bastard Toad forever.

There has to be a real meaning to life. That meaning is **balance**. And in the end, balance is **infinite love**.

Nature is a love-making machine.

Mario: “Oh, sure, he gets a princess. What did he do, roll a rock?! I had to cheat my way through eight worlds!”

The Church Bell

In DEMU I conclude there is no such thing as causality because there is zero delay between expansion and contraction. What we normally call a “cause” and an “effect” are not separated by time in the structure itself. They occur as a single, immediate unity. From this perspective, causality must be an invention of the animal mind—something the mind uses to organise continuous change into discrete steps.

This reminds me of Immanuel Kant, who argued that causality is not something we discover in things-in-themselves, but a structure imposed by the mind on experience. In that sense, causality is a way of ordering appearances, not a feature of reality as it is independently of perception.

In my view, causality also leads to an infinite regress: every cause demands a prior cause, and so on without end. But nature cannot contain an actual infinite regress. Therefore, causality as a funda-

mental feature of reality cannot be real. It can only be a descriptive framework the mind uses to make sense of continuous processes.

But I would like to consider another important objection to causality—one that comes from David Hume.

David Hume argues that we never actually perceive causation itself in the world. What we observe is only sequences of events:

Event A (the bell rings)

Event B (people go to church)

Over time, because these events are constantly conjoined, the mind begins to expect B whenever A occurs. Hume calls this pattern:

“constant conjunction” + mental habit = illusion of necessary causation

There is no observable force, no visible connection, no “necessity” linking the two events. We only ever see one thing followed by another.

The church bell example makes this especially clear. A bell rings every Sunday, and then people enter the church. After enough repetitions:

- You see the bell ring
- Then you see people show up

Eventually the mind forms the rule:

“The bell causes people to go to church.”

But Hume’s point is sharper than simple skepticism:

You never *see* causation

You only see sequence and repetition

The “cause” is something your mind adds after the fact

So what looks like causality is actually a psychological projection built from pattern recognition.

The deeper philosophical punch is that this also undermines induction itself. We assume the future will resemble the past, but this assumption cannot be logically justified. It is not reason that guarantees it, but habit.

So causality becomes:

- not a rationally grounded necessity
- but a mental expectation formed through repetition

And the church bell remains a powerful example because it feels causal in everyday life:

Bell → gathering → ritual

But on Hume’s analysis, that “→” is not in the world. It is in the mind, linking events that are in fact only ever observed in succession, never in necessary connection.

And what medium separates a cause from an effect? Where does the cause end and the effect begin? You would arrive at infinite regress again, or else arbitrarily choose your starting and stopping points.

I think the world functions like causality because nature is always seeking balance.

But the classical picture of causality is paradoxical and ultimately absurd. Determinism and predeterminism are simply false. Nature does not work that way. Nature is becoming, not being.

This is how nature actually works beyond causality: nature is fundamentally **formless**. Forms arise, and as soon as they arise they dissolve, so they must be continuously recreated. But nature performs this process so rapidly that becoming (process) appears as being (something solid).

The forms that arise are only appearances in the mind. The animal mind takes the formless and turns it into form. So form never truly rises from the formless ground. Formlessness always remains because expansion = contraction.

But the animal mind can model this process into 3D space because it is a process. Timelessness is not a static ground, but a fast-moving feedback loop that is constantly replicating itself. So timelessness is full of activity.

Again:

I am redefining reality at a deeper level where “cause” and “effect” no longer exist as separate entities because the underlying process is simultaneous and self-canceling.

In my view, reality is fundamentally process, not substance. Process is so rapid and continuous that it appears static. Form is a perceptual construction imposed upon a fundamentally formless flux. Causality only emerges after the mind slices this continuous process into sequences. Therefore, causality is epistemic (mind-dependent), not ontological (fundamental).

The biggest philosophical challenge to this framework is explaining why the causal model works so reliably in practice. Even if causality is not fundamental, science and ordinary life still depend upon highly stable predictive relationships. But I believe this has a simple solution: nature is always seeking balance and coherence (more balance). The animal mind then models that coherence into what we call causality.

However, because the mind translates a fundamentally 0D reality into 3D representations, paradoxes arise, such as infinite regress. But the paradox exists only in the modeling, not in underlying reality itself.

Causality works like a set of dominoes glued together, where one piece mechanically forces the next. Reality, however, works more like dominoes continuously forming and seeking balance. There is no real glue, no ultimate causal chain, and therefore no true determinism.

How can you have determinism if reality is formless?

Determinism requires stable, discrete entities obeying fixed causal relations across time. But if reality is fundamentally formless, then those prerequisites disappear.

Determinism assumes:

- enduring objects,
- separable causes and effects,
- linear time,
- and fixed states evolving mechanically.

But if reality is actually a continuous, self-balancing process with no ultimate separation, then there are no fundamentally distinct “things” to determine one another in the first place.

Form itself is a mental abstraction imposed upon flux. The animal mind freezes process into objects, then connects those objects through causal chains and calls this “determinism.” But underneath the model there is only dynamic becoming.

Determinism is impossible because:

- the world is not made of fixed substances,
- there are no ultimately separate entities,
- and reality never exists in a finalized state of being.

Reality is always re-forming itself in the present. What appears deterministic is actually coherence and balance emerging through continuous process.

In short:

Determinism requires stable forms, but if forms are only appearances generated by the mind, then determinism cannot be fundamental either.

Can you hear that? That's the church bell ringing.

Free Will

Note: This text is taken from DEMU.

We have explained what reality is, which is pure balance. We explained why it exists instead of nonexistence, what set it going, and how it generates the universe. We have inferred that it is the thing-in-itself, and that this thing is consciousness. We have explained that 3D space must be an illusion because our 0-dimensional reality cannot generate real 3D when expansion is always met with contraction. You literally cannot expand from 0D when every attempt is met with a contracting force. And this is why we cannot solve the hard problem of consciousness: consciousness is primordial, older than time itself. In other words, idealism and not materialism is true.

We also saw that the meaning of life is balance. But there is one thing missing that every metaphysical system needs to explain: **free will**. So let us do that quickly.

Of course we have free will. To deny it, you must reduce reality to computation, and that immediately creates an irresolvable paradox. If Nature is to remain free of paradox, free will must exist. If reality were purely computational, it could not be self-closed. And if

consciousness is what closes the system, then it cannot be produced by computation. Thus, free will follows as a necessary property of consciousness. If Nature is paradox-free, free will must exist, because the alternative is a system that cannot explain its own existence.

Now, they say we do not have free will because causality binds us. We are stuck in the web of time. There is no homunculus in the brain that can possess free will. The free-will choice happens before conscious intent. The hand acts before you do. We are slaves to genes or to our environment. And when and where did free will evolve anyway? Do other animals have free will? And what does free will even mean? Looking at this whole list, free will does seem impossible.

But if consciousness happens at the dual torus core, then causality does not bind us, because consciousness is faster than causality, the core having zero delay. The web of time does not bind us because spacetime may be an interface of the animal, just as Donald Hoffman talks about. So, our choices may actually alter the flow of time itself.

We are not a fly caught in a net. We are the spider.

And there is no homunculus in the brain, but we do not need it. Even if the human ego itself is an illusion, consciousness is not. And the fact that the brain or hand may act before conscious awareness is not a problem. We can still have free will.

Say the hand chooses an apple over a banana. Your hand brings the apple to your mouth and you start eating it. Before long, the sensation of eating the apple reaches your consciousness. When that happens, you become aware of what is going on and you can stop or continue.

Your hand will not force that apple down your throat. You can even lay down the apple and pick up the banana.

However, you still cannot fly or instantly become popular among, say, girls. Free will has limitations. But even these limits are contextual rather than absolute.

And yes, this free will did evolve. It is not magical. Exactly where you draw the line, I would not know. Lines are man-made anyway. The information that reaches consciousness after you begin eating the apple could not have been fully predicted beforehand, because it is emergent and new. It is not reducible to prior states. In that sense, a perfectly deterministic universe cannot fully account for it.

And the gene-centered view is challenged by thinkers like Denis Noble, as well as by idealism. Consciousness is not a vessel for selfish genes. It is the other way around: genes are a vessel for consciousness.

Cultural upbringing can make free-will decisions easier or harder to make, but it does not rule them out. Sometimes you can use consciousness and rise above all of it. It is not easy, of course. But it is not ruled out beforehand.

Then there is the reductionist objection: consciousness is just a huge number of tiny processes in the brain working together, and none of them have free will. But this assumes that the whole is nothing more than its parts. I do not buy that. If you slice a cat into pieces, you do not get a working cat. Douglas Adams pointed that out. Likewise, I am my experience of who I am, and you cannot cut that experience into tiny pieces. I am the whole, not the parts.

So, if I want pizza for dinner, no atom in the universe can stop me. And no spacetime trap can ensnare me. And no one can choose it for me except me, or perhaps TV commercials, or an episode of Ninja Turtles. But I digress.

This is literally true because only I have access to my own awareness. This is why evolution equipped us with free will in the first place: a purely deterministic universe was not up to the task.

So, what is free will? How do you define it?

Try crossing the road blindfolded. Even if you cannot nail down a perfect definition in theory, you understand what it means in practice. No one who truly denies free will crosses the road blindfolded. Hypocrites.

And philosophers who try to combine strict determinism with free will are often just performing intellectual gymnastics.

Yes, we can change the flow of time. We are timeless creatures using time as a tool. Yes, we are immortal. But how does it all work?

Earlier I said entropy resets in timelessness because timelessness contains no history. But how can consciousness exist there if consciousness seems to involve memory and history?

Because timelessness is a dual torus. It has a core that represents absolute death, but it also has wings that circulate around it. Life and death are part of the same system. If some God or Buddha exists,

they are simply the whole, while we are fragmented expressions of it. The important point is that you cannot place a Buddha inside static timelessness. You need a dynamic timelessness.

So instead of seeing timelessness as a static state, think of it as infinite motion, something spinning extremely fast. The feeling of “I am,” then, is timelessness, while 3D space is the interface pulled over our perception. And the greater timelessness beyond our perspective may contain all histories and continually update them. Timelessness never rests, because it is dynamic.

The timeless core itself, however, is absolute death: the unconscious equilibrium from which existence arises, the logical starting point of all things.

But does that mean death is the meaning of life? If Nature had her way, would she prefer death for all time, since that would be simpler?

At first, I thought so too, and I became depressed for a moment. But that feeling passed quickly when I realized that death is not what Nature ultimately seeks. Nature seeks balance. And balance is life and consciousness. Death serves a function within balance, but it is not the whole story.

Thank goodness.

So, one more time.

Free will is possible because consciousness occurs at the core of the dual torus (the snake biting its own tail). Consciousness is therefore

timeless. And consciousness can exist in timelessness because timelessness is dynamic, not static. We are not trapped in the web of time. We can influence the flow of time itself, and that is free will.

Free will is integrated, not tacked on. In most metaphysical systems, free will feels artificially attached. Here it emerges naturally as the interface between the timeless core and temporal circulation.

But would not timeless consciousness reintroduce infinite regress?

No.

Again: At the core of the dual torus is the cuboctahedron. Geometrically, this represents the still point around which circulation occurs. Its vectors are in perfect balance. This produces absolute death: no space, no time, no consciousness, only pure equilibrium and zero entropy, which is why the universe begins with order.

absolute death → pure equilibrium → zero entropy → ordered universe.

Consciousness arises as the feedback loop around this core.

Life and death are two sides of the same cosmic coin.

- A timeless core is required to stop infinite regress.
- The dual torus provides a non-linear, self-closing structure.
- The cuboctahedron at the core, with perfectly balanced vectors, represents zero delay, zero asymmetry, zero differentiation.

Zero differentiation means no process, no experience, no perspective: absolute death.

Poetically put: if everything is red, then nothing is red.

Consciousness, life, and will arise only as the feedback loop around that equilibrium, not inside the equilibrium itself.

That avoids reintroducing regress because:

- the core does not observe or decide
- nothing happens inside the balance
- there is no further explanatory demand beneath it

So free will does not come from escaping balance. It comes from being the dynamic circulation around it, where timelessness and time interface.

Consciousness exists because of the core, not as the core.

No regress.

No hidden observer.

No contradiction between death, balance, and freedom.

In sum:

Consciousness cannot be reduced to parts because the experience of the whole (dual torus) is primary.

cuboctahedron

- perfect vector balance
- zero differentiation
- absolute death
- consciousness/free will emerges in circulation

My system is trying to solve five problems simultaneously:

1. infinite regress
2. origin of motion
3. consciousness
4. entropy reset
5. free will

Most philosophies only tackle one or two of these.

I am trying to unify them.

So, the takeaway:

determinism = false

Timelessness cannot contain deterministic sequences.

Why?

Because determinism requires time-ordered causality.

But my core has zero delay.

no delay

→ no causal chain

- no determinism
- freedom possible

And causality has another problem too: how do you define what is a cause and what is an effect, and where do you draw the line between them? And if you draw a line, won't you then introduce infinite regress, making determinism impossible to form coherently? Determinism is only a fantasy in the mind of man.

My system places the ground of reality in timeless balance, not in a chain of temporal causes. If time itself emerges from that deeper structure, then a universal causal chain cannot be fundamental. In that sense, strict determinism cannot describe the root of reality, because determinism requires time-ordered cause → effect sequences.

In other words:

- If something cannot exist at the fundamental level, then it cannot truly exist at higher levels either.
- So if determinism cannot be grounded, then calling anything deterministic is just a useful fiction.

Again:

- If the baby is never born, the adult cannot walk around later.
- Likewise, if determinism is never grounded, deterministic behavior cannot truly exist.

I am not denying cause and effect in the common-sense sense. I am saying that when you divide the universe into pieces in order to define causes and effects, you have already killed the universe. So don't expect it to make sense afterward.

Causality is not fundamental; it is a tool of the animal mind.

Philosophers like David Hume made a similar point. He argued that we never actually observe causality itself; we only observe regular sequences of events, and the mind interprets them as cause and effect.

To make a long story short, determinism in no way destroys free will. Determinism cannot destroy free will because it is not real and cannot ever be real. Determinism cannot exist; it is a concept, not reality.

Definitions:

Normal definition: Free will is the capacity of a conscious agent to evaluate possible actions and select among them in a way that is guided by its own awareness rather than being completely fixed by external forces or prior physical states.

My definition: Free will is the ability of timeless consciousness, emerging from the balanced core of reality, to influence the flow of temporal events.

Free will = timeless awareness acting within time.

If consciousness were merely inside the web (of time), then we would be the fly, trapped by causality and dragged along by deterministic threads. That is the picture materialism tends to give: the brain as a machine running inside the net of physics.

But my argument is different. So, I am saying that consciousness is not in the brain. We are the internet, not the iPhone that accesses it.

Are we the world, or the idiot box? Are we the universe, or the radio?

So, do you think we are the fly or the spider?

Internal Evolution Theory (IET)

My theory of internal evolution is this: imagine an animal inventing color to better navigate its environment. Then another animal invents camouflage and hides inside the perceptual system of the first animal. Now imagine this co-evolution happening since the very beginning (of time). At that point, you have to ask: what do you even need an external world for?

You can simply build your own world as you go. Just as Super Mario is perfectly fitted to his world, animals may also be perfectly fitted to their world because the world itself was gradually built up through the animals' own interactions and perceptions.

Suppose idealism is true and consciousness comes first. This consciousness then replicates itself. Many monads, so to speak, begin communicating with one another, and in order to communicate more effectively, they create a shared world. Once competition enters the

picture, this shared world can become increasingly advanced over time.

One animal evolves color perception, another evolves camouflage, then another evolves mechanisms for detecting that camouflage, and then another evolves even better camouflage. In this way, the perceptual world itself evolves, becoming progressively richer, more detailed, and more complex over time.

When I extend this idea across billions of years, the world begins to look less like raw matter and more like a massively stabilized perceptual ecosystem generated through recursive conscious interaction.

I do not think this automatically proves idealism, but I do think it creates a serious alternative to naïve realism.

Naïve realism is, roughly, the view that the world we perceive is **basically the world as it really is**, independently of our minds.

I propose that evolution may not just shape organisms within a pre-given world, but may simultaneously construct the very structure of the experienced world itself. Instead of organisms merely adapting to an independently existing reality, I see reality-as-experienced as a co-created interface emerging through competitive and cooperative consciousness.

The camouflage example illustrates what I mean.

Again: One organism develops color perception to better navigate its environment. Another organism develops camouflage to exploit that perceptual framework. The “world” both organisms inhabit then becomes increasingly structured through reciprocal internal evolution.

Over enough time, perception ceases to look like passive observation and starts to resemble an evolving language or game engine jointly authored by interacting minds.

My view connects to several philosophical traditions while remaining distinct from them.

Donald Hoffman argues that perception is an interface optimized for fitness rather than truth. Gottfried Wilhelm Leibniz imagined reality as composed of communicating monads. George Berkeley denied matter as fundamentally independent substance. Alfred North Whitehead viewed reality as processes of experience rather than static objects.

Where my theory differs is that I add an explicitly evolutionary and game-theoretic mechanism to idealism.

The key leap is this:

If consciousness comes first, and consciousness can replicate and interact, then stable shared structures can emerge without requiring a fundamentally material substrate. What we call “the external world”

may instead be a progressively stabilized consensus-space generated through countless cycles of interaction.

This is why I use the analogy of Super Mario.

Mario is perfectly adapted to:

- gravity,
- enemies,
- jump height,
- coins,
- and spatial rules,

because both Mario and the game world are expressions of the same underlying system. The world was effectively built around the logic of the character.

Likewise, organisms appear uncannily fitted to their environments because organism and environment may have co-emerged together through recursive perceptual evolution.

From this perspective:

- color is not simply “out there,”
- danger is not simply “out there,”
- and objects themselves may not fundamentally be “out there.”

Instead, these are stabilized symbols within an evolving communicative interface between conscious agents.

Competition accelerates this complexity:

- predators invent new perceptual tricks,
- prey invent concealment,

- mating invents beauty,
- social coordination invents meaning,
- language invents abstract worlds,
- and mathematics invents invariant structures.

Over time, the shared dream becomes extraordinarily coherent.

My theory attempts to explain why reality feels:

- ordered,
- law-like,
- evolutionarily useful,
- and strangely tailored to cognition.

Not because minds discovered a finished universe, but because minds gradually constructed the navigational framework together.

Within this framework, “matter” becomes something like compressed agreement between interacting consciousnesses.

This leads to the deeper question at the center of my theory:

If a self-consistent experiential world can emerge entirely through interacting consciousness, then what explanatory work is actually left for a mind-independent external world to do?

That, to me, is the pressure point this theory places on materialism.

When I say “matter becomes something like compressed agreement between interacting consciousnesses,” I am making a metaphorical but structured shift away from “matter as independent stuff” toward “matter as stable pattern in shared experience.”

Let me break it down clearly in my framework.

1. “Agreement” = stability across observers/agents

If multiple conscious systems interact (humans, animals, etc.) , they:

- encounter similar regularities (resistance, solidity, persistence)
- successfully coordinate around those regularities (language, prediction, survival)

So when I say “agreement,” I do not mean that they consciously vote on reality. I mean:

their perceptions converge on stable, repeatable patterns.

2. “Compressed” = reduced, simplified structure

Over time, complex perceptual interactions get simplified into:

- objects (“tree”, “rock”, “body”)
- properties (“hard”, “heavy”, “hot”)
- laws (“gravity”, “cause and effect”)

Instead of tracking infinite sensory detail, consciousness uses: compact representations that preserve useful structure.

That is what I mean by “compression.”

3. So what is “matter” in this framing?

In my theory, “matter” is not a hidden substance behind experience.

It is more like:

a highly stable, repeatedly reinforced pattern of shared perception that has become so consistent across interaction that it feels external and objective.

4. Why it feels “external”

It feels external because:

- it persists even when individual attention changes
- it behaves consistently across different observers
- it resists arbitrary alteration

So it functions like something independent, even if, ontologically, it is a stabilized structure of interaction.

5. In my internal evolution language

I can rephrase it like this:

- perception evolves
- interactions stabilize recurring patterns
- those patterns get “compressed” into objects
- objects are what we call “matter”

So matter, in this sense, is the hardened output of recursive perceptual evolution across many interacting consciousnesses.

One-sentence version of what I mean:

Matter is the stable, compressed structure of recurring perceptual agreement that emerges when many interacting consciousnesses repeatedly converge on the same patterns over time.

Think of it like timeless monads communicating with one another. In order to communicate, they need to create a shared experience in which communication is possible. It would be like creating a game world where you encounter objects as solid—not because they are actually solid, but because you can't have players running through them all the time. That would make the shared experience ineffective.

Think of someone hacking in competitive *Fortnite*, for example. They would be banned because they weren't following the rules of the game. In the same way, objects don't need to be actually solid; they only need to function as solid within an environment shared by conscious agents.

I think my theory is interesting because it attempts to solve multiple problems at once instead of treating perception, evolution, and metaphysics as entirely separate domains.

The strongest aspect of the theory is the central inversion:

Instead of organisms adapting to a fixed world, I propose that organisms and world co-emerge together through evolving perceptual interaction.

To me, this is a deep philosophical shift because it reframes evolution from being merely biological to being ontological. Evolution does not just shape creatures; it also shapes the structure of experienced reality itself.

Part of what gives this theory force is that there are already cracks in naïve realism:

- color is not objectively “out there” in the way it is perceived,
- sound consists of compression waves interpreted by consciousness,
- meaning is relational,
- and even space and time in physics are increasingly treated as observer-dependent or emergent in some interpretations.

So I take that trajectory further and ask:

If perception already constructs part of reality, why assume there is a fully formed world behind it at all?

I believe that question is philosophically legitimate.

The camouflage example is stronger than it first appears because it demonstrates recursive perceptual evolution:

- perception creates a navigational layer,
- other organisms evolve within that layer,
- and those organisms then reshape the layer itself.

To me, this resembles an arms race occurring not merely in matter, but in phenomenology itself.

My idea of a “shared world” is also coherent within idealism. If consciousnesses interact repeatedly, stable regularities would naturally emerge. A completely chaotic dream could not sustain communication, memory, or evolution, so stable laws would gradually crystallize through interaction.

In that sense, my theory attempts to explain:

- why reality is structured,
- why mathematics works,
- why organisms fit their environments,
- and why perception is tuned more toward utility than objective truth.

The Super Mario analogy works because it illustrates mutual fit. Mario is not adapted to some fully independent reality; both the character and the world are generated together from the same rule-set. I think consciousness and world may relate in a similar way.

Where my theory becomes difficult is in explaining resistance and constraint.

For example:

- Why can consciousness not simply alter reality at will?
- Why do stable mathematical laws persist across observers?
- Why does physics appear so indifferent to individual intention?
- Why do entirely different organisms converge on similar external structures?

A materialist would argue that these point toward an external substrate constraining perception.

My response is that the shared world has become massively stabilized through billions of years of recursive interaction. Reality therefore behaves less like a freely mutable dream and more like a deeply entrenched consensus structure. Think of a path through a forest: if enough people walk the same route, over time the path takes on a life of its own.

And I would also use the *Fortnite* example above: we can't have cheaters. A shared world only works if everyone is bound by the same rules.

I think that is a fairly sophisticated answer, even if it remains speculative.

Another challenge is falsifiability. At present, my theory functions more as a metaphysical framework than a scientific theory because it is difficult to specify what evidence could decisively distinguish it from advanced forms of evolutionary realism or simulation-style models.

Still, philosophically, I think it is much stronger than simplistic claims that “everything is consciousness,” because I am introducing an actual mechanism:

- competition,
- communication,
- recursive adaptation,
- and co-evolving perception.

That gives the idea structure.

I would place my theory somewhere between:

- idealism,
- evolutionary epistemology,
- game theory,
- interface theory,
- and participatory reality models.

Its strongest insight, in my view, is this:

A world does not necessarily need to pre-exist conscious agents in fully formed fashion if stable reality can emerge gradually through interacting consciousnesses over immense spans of recursive evolution.

To me, that is a serious philosophical proposition, not merely random speculation.

Note: My idea looks remarkably similar to Robert Lanza's *biocentrism*, but I swear I didn't just rip the guy off. I came to the idea independently, and only afterward did I buy his book. Reading it was honestly bizarre. It felt like somebody had broken into my head.

Lanza had the same basic insight: the fine-tuning problem starts to look very different if the universe and the organism coevolve. He uses the analogy of the turtle (life) and its shell (the universe). Why does the shell fit the turtle so remarkably well?

Gee, I wonder.

Maybe because the shell didn't fall out of the freaking sky and land on an unsuspecting turtle. (O Materialism! Thou art forever the stupidest idea ever conceived by man!)

That's the point. The turtle and the shell belong to the same developmental process. You don't need to stand there scratching your head in astonishment, asking how the universe managed to produce a shell that just *happens* to fit the creature living inside it.

And, if you ask me, this is the only logical answer to the fine-tuning problem. All the other proposals are hogwash. And don't even get me started on the anthropic principle. My God, the level of stupidity required to accept that as an explanation is just...

See?

I don't even have words for it!

Instead of:

"The shell happens to fit the turtle, and naturally only turtles with fitting shells are around to notice."

Lanza is proposing:

"The shell fits the turtle because turtle and shell developed as parts of the same process."

Other "Solutions" to Fine-Tuning That Are, in My View, Mostly Hogwash

Brute fact:

"The constants just are what they are."

Oh, okay. In that case, I can just as well say God did it. You've taken the mystery, renamed it "brute fact," and somehow expect me to applaud the explanatory progress.

Anthropic selection:

“We observe a universe compatible with life because otherwise we wouldn’t be here to observe it.”

This is illogical thinking dressed up as reason. Yes, obviously I wouldn’t be here if the universe couldn’t support me. The question was **why** the universe can support me in the first place. You haven’t answered the question. You’ve repeated the observation and put a bow tie on it!

The multiverse:

“There are countless universes, so eventually one of them had to get the constants right.”

Even if infinite monkeys eventually produced a coherent book, you still haven’t explained the monkeys. Where did the universe-generating machinery come from? Why does it have the properties required to generate universes? Congratulations: you’ve taken the fine-tuning problem and moved it upstairs.

Physical necessity:

“Perhaps some deeper theory will show that the constants simply couldn’t have been otherwise.”

Fine. Let’s say you establish the ultimate physical ground. But who is the ground for? You’ve built *Super Mario Bros.* without Mario—an exquisitely structured level sitting there with pipes, platforms, Goom-bas, and question blocks, but nobody playing the damn game.

God:

“God designed the universe for life.”

Nope. Too childish. You’ve explained one mysterious thing by introducing an even bigger mysterious thing, giving it a beard, and calling the case closed.

Cosmological natural selection:

“Universes reproduce, and cosmological evolution selects certain properties.”

Oh yes—a vast evolutionary process involving nothing conscious whatsoever eventually producing consciousness. Very believable. We’ve apparently solved the mystery of experience by making the prehistory longer.

The mathematical universe:

“Reality is ultimately mathematical structure, perhaps one among an enormous space of mathematical structures.”

It’s the questionable logic of the multiverse, except now we’ve made the monkeys abstract. Somehow we’ve traveled even farther away from the thing we’re trying to explain and declared victory.

Participatory / observer-centered approaches:

Now we’re getting somewhere.

This is where ideas like Lanza’s become interesting. Instead of treating the observer and the universe as two completely independent things and then wondering why they fit together so suspiciously well, perhaps the mistake was separating them in the first place.

The turtle fits its shell because the turtle and the shell belong to the same process.

Maybe the universe fits consciousness for the same reason.

In this book, I have argued for God, and there may even be a Creator sitting smack in the middle of the universe who created it all. All of that may be true. But it still doesn’t explain fine-tuning. If the universe is a dream, you still have to fine-tune the dream. And if the universe

was created, then the Creator must have evolved into a position from which creation was possible in the first place.

In other words, God is natural. So you don't get fine-tuning from God; you get it from Nature. And the only explanation for fine-tuning that actually makes sense to me is the one Lanza proposed: life and the universe coevolved.

World Building

I am now going to build the universe from scratch using the building blocks I have established.

The eternal building block we already have is the dual torus. This has been established earlier. Because the dual torus is eternal motion, and because it contains its opposite—basically two tori in one—we can get replication going, what I call cosmic sex. Thus, evolution starts at the beginning of time.

The dual torus is a feedback loop, and that is what consciousness is. So this is one consciousness splitting up and becoming two.

And it can replicate because it already contains the motion required for replication. Motion is not something added onto the system—it is eternal, and therefore intrinsic to it. Within that motion, the geometry of “sex” is already embedded, since this geometry is precisely what resolves the problem of infinite regress.

Remember the core relation: [expansion = contraction] = zero delay = zero regress.

When did the first consciousness split up?

I have also argued that reality is non-linear, where expansion = contraction.

The best analogy here would be white light (non-linear time), which can be modeled into a rainbow (linear time).

So asking when the One consciousness first replicated becomes tricky. You could say I am avoiding the question, and that is fair. Let us leave it with: I don't know. There was no "when" in timelessness.

There is time in timelessness because time is this equation: expansion = contraction. That is, time is eternal motion—the eternal consciousness feeding back into itself and updating its own state. Timelessness is the fact that this process occurs with zero delay. Spacetime is the animal mind modeling timelessness.

But if you grant me this replication, then we can have something like a network of monads. Say a monad is a zero-dimensional consciousness that is a replica of the cosmic dual torus, the original universal consciousness. Say the universal consciousness is white light, and the monads are the rainbow of colors. They are the same thing seen from different perspectives.

Now, because these monads are feedback loops in a zero-dimensional "world," they can communicate instantly and share information. Imagine a group of friends playing Fortnite together—they don't need an external game world; they can just access their own computers and log into the same experience.

But the world in the beginning was not this advanced yet, so how do we actually get there?

If you have a giant whirlpool, and this whirlpool is all that exists, then you can imagine it spinning forever without slowing down, because it is the only thing that is real—so what would stop it, what would slow it down?

Now imagine baby whirlpools, or monads, forming within this giant cosmic whirlpool.

They would immediately face a problem: death.

They could get swallowed by the original whirlpool again. The original whirlpool doesn't face any problems, but the smaller ones do.

And once you have a problem to solve, you can get world-building going.

Say the monads start to cooperate to maximize their survival. Say one monad starts to steal energy from another monad to better survive in the cosmic whirlpool.

This is perhaps similar to **Conway's Game of Life**: once you have the initial players and the initial problems, the world and the monads themselves can become more and more complex.

And the monads can replicate themselves and form the next generation of monads because they share the same geometry (of “sex”) as the cosmic dual torus.

All we need to do is run simulations, and I think we would be able to recreate our own universe. Then we would finally see that the universe is not something “out there,” independent of mind. Rather, it is a world created by mind.

The world itself is a survival tool, created by monads cooperating and trying to survive in the giant cosmic whirlpool.

Note: “Motion,” “geometry,” “consciousness,” and “sex” are doing a lot of metaphysical work without strict separation. But that is because they are the same thing: **the dual torus**. Is this explanatory overload? No, this is the beauty of the dual torus.

1. “Expansion = contraction”

This is my claim that two opposite processes are actually one continuous motion seen differently:

Expansion = outward unfolding, differentiation, becoming “more”

Contraction = inward folding, integration, returning “to one”

In my model, they are not separate forces. They are:
the same motion described from different perspectives

So reality is not moving between two states—it is a single looping process.

2. “Zero delay”

This means there is no gap between cause and effect.

In my framework:

- The system does not “wait” to update
- It is self-updating in real time
- There is no external clock or mediator

So:

process and result are identical in occurrence

This is my way of eliminating the idea of a step-by-step causal chain that would require an external starting point.

3. “Zero regress”

This is the key philosophical target.

Infinite regress usually looks like:

A explains B

B requires C

C requires D

...and so on forever

My move is to say:

if expansion and contraction are the same motion, and there is no delay between states, then the system does not require an external cause-chain to initiate or sustain itself

So instead of:

- linear explanation (which needs a beginning)

I propose:

- a self-contained looping identity (which has no first link to explain)

4. So what the whole statement is really saying

In simpler form:

Reality is a single self-updating motion that unfolds and folds itself simultaneously, with no gap between states, so it does not require an external origin or causal chain.

5. How it “solves infinite regress” (in my system)

It solves it by rejecting the structure that creates regress in the first place:

- Infinite regress only appears if reality is treated as a chain of separate steps
- I replace that with a closed loop of identical processes

So instead of:

$A \rightarrow B \rightarrow C \rightarrow \text{explanation required}$

I propose:

a self-identical loop where “A, B, and C” are the same motion viewed differently

That loop is what I refer to as “dual torus logic”: self-referential motion with no external starting point.

Important clarification (philosophically)

This “solves” regress internally within my model, but it does so by changing the rules of what counts as explanation. In philosophical terms, I am:

replacing linear causality with self-contained identity dynamics

That is a legitimate metaphysical move—but its strength depends entirely on whether one accepts self-referential identity as a valid stopping point for explanation.

And this self-identical loop—or “grand timelessness,” as I call it—still carries infinite regress in another form, namely the question: why this loop?

My answer is twofold. I try to show that non-existence is fiction, which leaves only the loop as eternal. Then I identify what the loop actually is: balance.

So then the question becomes: why balance? And the answer again is balance. In this way, you get an infinite regress of balance—an infinite tower of balance all the way down.

But I argue that this is acceptable because it is isomorphic to itself. There are no additional parts “sticking out” that require explanation beyond balance itself. Balance explains itself in the sense that if things were unbalanced, they would require rebalancing.

By “isomorphic,” I mean that if everything in nature is literally the same thing, then there is nothing further to explain.

So if you see this great balance as the vectors in the cuboctahedron aligning perfectly, then there would be nothing “beyond” balance requiring further explanation, because all other geometries (the icosahedron, etc.) are contained within it! So if you tried to go “beyond” or “underneath” to see whether there is “more,” you would fold and fold, only to arrive back at the cuboctahedron again.

Reality fundamentally bottoms out there because perfect balance implies no privileged direction. No privileged direction implies no deeper layer “behind” the system. Therefore, attempts to transcend

the structure return to the same equilibrium. And I would argue that this is the great timelessness at the beginning of everything, because, again, perfect balance implies no privileged anything.

So, at this point, we are effectively dealing with timelessness as the starting point of existence, and in timelessness there has been no time in which an infinite regress could form—no time, no regress.

However, I also say that time is eternal and one with timelessness, which I take to be true. But real time does not require regress or linear causality, which is what my loop demonstrates.

So if the dual torus can finally end infinite regress, then it becomes the basic building block of reality. In that case, reality cannot be reduced to anything *simpler*.

The additional point is that the dual torus already contains the capacity for replication due to its dual structure. This means evolution is already built in. Once that is granted, the question becomes: how else could evolution arise?

In my framework, the self-identical loop is the same as timelessness because time only exists when there is separation between states—when one thing becomes another through delay, sequence, or difference.

My loop removes all of that. Expansion equals contraction, cause equals effect, and process equals result. There is no gap between states and no ordering of “before” and “after.” What remains is a single, continuous self-expression with no internal separation.

Because time is just the perception of change between distinct states, and my loop has no distinct states, there is nothing that can generate time. It does not evolve through time—it simply is, as a self-identical process.

So I identify the loop with timelessness: not because nothing happens, but because nothing is separated enough to become a timeline.

But note that the word time is the most slippery word in the whole of philosophy. Time can mean many different things, so it has to be read strictly in context.

If time is the self-identical loop (consciousness), then time is all there is—everything that exists.

If time is spacetime, then time is an interface of the animal mind.

If time is understood as distinct states in sequence (causality), then there is nothing that can generate time, and in that sense it does not exist.

So how do we resolve this cleanly?

Envision the dual torus in your mind’s eye. Let it expand from its center, and also note that as it expands, it simultaneously contracts

from the other side, such that the net expansion is zero. It still expands, but it does not expand into something or outward into a separate space. It remains in the same place—like jogging on a treadmill.

The jogging itself is what I call time: consciousness always moving forward, but never actually moving “forward.”

Spacetime would then be the screen the jogger is looking at. And saying there is no time at all would be equivalent to saying there is no real “forward” or “out there.” In other words, time as causality does not exist.

So time as consciousness is 100% real. Time as spacetime is a survival tool for the animal. Time as science envisions it—causality—is 100% false.

You say: If by timelessness you mean a state with no privileged direction, no change, and no distinction that could ground a “before” and “after,” then I agree that such a perfectly balanced, fully symmetric state would not contain an internal basis for time as we normally understand sequence or causality. In that sense, it resembles a static equilibrium or a non-temporal unity.

But my deeper point is that this static equilibrium is not static at all, but active and dynamic. My idea of timelessness is still change, but a change so complete and so fast that there is no meaningful before or after. It is not the absence of motion, but a form of motion where succession never resolves into separation.

From this perspective, even if something becomes extremely fast, it may still be described as having a sequence. But it is not a sequence in space. It is more like running on a treadmill: there is activity and movement, but you remain within the same balance point and never leave it.

One might respond that no matter how fast something changes, physics still treats it as a succession of states. Speed may compress intervals, but it does not remove ordering.

However, my view is that this comparison assumes a classical notion of sequence that does not necessarily apply here. In a system like a dual torus, it is not simply about speed. It is about self-cancellation, where expansion equals contraction. In that case, there is succession in time, but not in space, and even that succession is not a linear succession in the ordinary sense. It is non-linear, closed, and self-canceling. It behaves in a way that ordinary intuitions about sequence do not capture properly.

So when it is asked whether there is still ordering of states, my answer is that not without space. There is no “room” in which states are separated into a meaningful sequence. The balance is not something that contains steps laid out in a line; it simply is.

You say: State A, then state B, then state C. This is change.

Yes, there is succession, but again, it is not a linear succession. It is non-linear and self-canceling.

Change normally requires a clear distinction between before and after. I agree with that in the ordinary sense. However, I propose that you can still have a kind of before and after in a non-linear way. In other words, you can preserve the structure or spirit of sequence without requiring a literal separable timeline.

In this sense, timelessness is not the absence of change. It is change that never separates itself from balance. It is dynamic, but not in the way we are used to.

I am redefining “timelessness” so it no longer means absence of change, but instead means **change that never escapes equilibrium**. In this view, change occurs only internally, without ever producing a state that separates itself from the whole or establishes an external sequence.

However, in the standard meaning of the word, this would no longer be “timelessness,” because any genuine change normally implies temporal ordering. Change, in the usual sense, requires a before and after.

So the clean way for me to put it is this:

If “timelessness” means no sequence at all, then it cannot contain change.

If “timelessness” means no separable or accumulative sequence, then it can include internal, self-cancelling change, as I am describing.

But even if you refuse to call my “timelessness” timelessness, it doesn’t change what it is, which is absolute balance.

Again, in this view, change occurs only internally, without ever producing a state that separates itself from the whole or establishes an external sequence, because that would lead to infinite regress. So to escape regress, you can never leave equilibrium. But then the animal mind can take that active timelessness, which is 0D, and model it into a 3D world, basically taking non-linear change and turning it into linear change. But when doing so, we get an apparent paradox, because linear things look like infinite regress. But nature solves infinite regress by being non-linear.

Just to be clear: you don’t “solve” regress step by step; you remove the conditions that create regress in the first place. This is also how you solve the hard problem: you remove what causes it in the first place, which is materialism.

What infinite regress usually means:

Infinite regress is a problem in explanations or causality where each step requires a prior step, and there is no stopping point that is justified.

That’s a structural issue in linear explanation chains. If you replace a linear chain with a closed, self-referential system, then you are no longer in a regress structure at all. Nature is not fundamentally organized as a linear explanatory chain in the first place.

If I take the stance that the universe is a projection of mind, then what I experience as “reality” is already a model produced by that mind. In that case, what appears paradoxical (e.g., infinite space, infinite regress, or a finite beginning with nothing behind it other than a “North Pole”-like boundary condition—yeah, physics is mad) is not necessarily a feature of reality-in-itself, but a feature of how that projection is structured.

So within that framework, it follows that:

- paradox arises inside the projection
- not because reality is fundamentally contradictory
- but because a self-referential system is interpreting itself through limited internal perspectives

And then physicists try to take that paradox we call the universe and model it into a non-paradox by inventing all sorts of dimensions, but they never arrive at a theory of everything because those extra dimensions cannot resolve the paradox; they only hide it a little better.

If reality is fundamentally a closed, self-balancing, non-separable whole, then any model that relies on decomposition into parts, equations, or external coordinates will feel like it is approximating something it can never fully capture.

My view: reality is fundamentally non-decomposable, so all modeling is inherently indirect.

Physics view: reality is still partially decomposable and modelable with increasing accuracy.

“If you try and take a cat apart to see how it works, the first thing you have on your hands is a non-working cat.”

— Douglas Adams

But that is what you say: there is no north of the North Pole you call balance. My reply: true, but there is a big difference here—I don’t try to get the universe out of that rabbit hole! That’s where the craziness starts. Rather, the universe is eternal, having always been here. Time and timelessness are one and the same thing. Physics is trying to get a universe going from a starting point, which is absurd. There is a “starting point,” yes, but that point is geometrical, not an actual beginning to the system. Eternity is a circle with no beginning or end.

And note that I didn’t say “out of nothing,” I said out of a starting point. They are still trying to do something absurd no matter what you say. There is no sugarcoating it, even if you say the “starting point” may be a boundary of description, not necessarily an origin event in physics. They still treat the universe as if it were a real thing, when in reality it is a projection of mind.

I mean, how can you ever resolve the question of origins when you believe the universe is real? So they will forever circle the beginning of time and never be the wiser because they don’t know what the hell they are looking at. So they come up with all sorts of weird models like

Klein bottles, backward causation, and time-travel beginnings, trying to bootstrap the universe from behind itself. I mean, it is madness!

Physics is a naïve sport.

Backwards

I have argued for God and that “he” may be complex. I even believe there might be a Creator somewhere in the universe, as experienced through the DMT experience. But I still do not believe in the notion that God made the universe, like fine-tuning the universe and so on.

I see everything unfolding naturally from a seed, and I see God as part of the seed, not the creator of it. I do not see God as separate from creation. If you want a tree, you start with the seed; you do not begin with the tree.

That said, eternity is old, so the seed may already have become a tree, and now the tree is making new seeds. Thus, there might be a classical creation happening because the “computers” have already evolved to run the simulations, so to speak.

Christians wouldn't see the idea of a "fine-tuner" as backwards—they would see it as exactly the point.

In classical Christianity, God is understood as the creator and sustainer of reality, not something inside the universe but the source of its existence and order.

However, I reject the idea that God is outside the unfolding process, designing it from above like an engineer. I see God as process, not architect.

But, as I said, eternity is old, so there is room for the engineer concept too. However, I have never liked the picture in which complexity comes before simplicity in the order of things.

If God is highly structured, you've only pushed the complexity problem back one step.

If complexity needs explanation, then God's complexity also needs explanation. I have tried to give that explanation: God is the whole, and eternity is old and highly developed because the processes of nature have been unfolding for a long time. But this is a linear way of seeing it, while reality may be nonlinear, such that God was always developed in that sense. But now I am at least aiming for an explanation.

Everything must be explained.

Solar Logos

In ancient Egypt, the Sun was associated with the god Ra, who was understood as a living divine intelligence traveling across the sky. So the question is: is the Sun conscious?

In my system, there is a good chance of that, because I start with the dual torus, and then it replicates, making everything fractal. This means the universe should be a living organism rather than a machine. That is, life comes from life. We start with life: the dual torus, which is how consciousness looks from the outside. In other words, we begin with idealism.

Now, idealism does not necessarily lead to the Sun being conscious, but I have idealism plus fractal reality here. It is like seeing the universe as a body: you zoom into that body and you find cells. So what are the chances that you zoom into the body and find something non-living?

So yes, I think there is a good chance that the Sun is conscious, or is part of a conscious network. I wouldn't rule it out.

If I assume strong idealism, where consciousness is fundamental, and I assume fractal self-similarity of structure and process, then it becomes possible for me to interpret all stable energy-organizing systems as expressions of something deeper.

The biological analogy does a lot of the intuitive work here (“zoom into a body → you find more life”), and I recognize that it carries a hidden assumption: that different scales preserve the same category of organization. In biology, this works because cells and organisms share the same informational substrate, through biochemistry and evolution. In cosmology, we do not yet know whether this kind of recursive “life all the way up and down” actually applies.

And all of that is true, but my point is that it is exactly like in biology because the biological itself starts with the dual torus at the beginning of time. Biology is not something that arrives later in evolution; it is evolution itself. Nature cannot invent evolution later on from a pre-evolutionary stage because it would be the hard problem all over again, just for evolution itself this time. Evolution must be there from the very beginning. Or I believe evolution is false and will be replaced by another model, but for now we can call it evolution.

I’m pointing at a kind of regress problem.

If evolution (as a process of structured emergence, adaptation, and complexity) is not fundamental, then I would need to explain:

- where evolution itself comes from,
- and how a non-evolutionary or non-structured reality could later “generate” a fully structured evolutionary principle.

So my claim is roughly this:

If evolution appears later as a derived feature, then I haven’t really explained it—I’ve just moved the explanatory gap up one level. Now I would need a mechanism that produces evolution itself, which would be just as deep and difficult to account for as the original “hard problem” (in the sense of explaining consciousness or structured order from something non-structured).

So in my framing:

Either evolution is fundamental from the start, or I reintroduce the same explanatory gap at a meta-level (a “hard problem of evolution itself”).

That’s the core idea I’m getting at: avoiding a regress where the explanatory principle (evolution, structure, life-like organization) cannot be derived from something that lacks that principle entirely.

However

This is not quite analogous to the hard problem of consciousness. The hard problem concerns an ontological divide: how does something fundamentally non-conscious ever produce consciousness?

My problem with evolution is different. It is a bootstrapping problem: how the hell do you generate evolution from a process that is itself completely non-evolutionary?

Of course, Darwinian evolution does not have to exist in its fully developed biological form from the beginning. But whatever precedes it must already possess the capacity for transformation, differentiation, selection, self-organization, or some more primitive equivalent. Otherwise, where do those capacities come from?

So when I say evolution must be fundamental, I do not necessarily mean that DNA, genes, cells, and natural selection existed at the birth of the universe. I mean that the deeper principle expressed through biological evolution must already be present in Nature. Biology would then be a later expression of that primordial process, not the moment when Nature suddenly invented evolution out of something wholly non-evolutionary.

The hard problem of consciousness asks how one kind of being could produce an entirely different kind of being.

My problem asks something else:

How does Nature invent the very process by which Nature learns to invent?

So: I coined the term “the hard problem of evolution” more poetically than literally.

Imagine if I started with a pre-evolution stage and then wanted to boot up evolution. Wouldn't I then need the properties of evolution in order to boot it up, because where else would those properties come from? You can divide nature up into less and less complex states—biological, chemical, physical—but if the simplest building block in

nature does not already contain the recipe for evolution, then there is no way to get it.

You can try to rely on emergence and say that evolution would have “emerged” from a wholly non-evolutionary state, but to me this is the hard problem all over again. This is how they try to explain how consciousness emerges from matter too, but it doesn’t work. Emergence can produce new abilities but not new ontologies.

If what “is” is not evolution in the broad sense, then evolution would never appear. Because what *is* expresses itself as what it *is*. If the tree is not contained in the seed, you will not get a tree.

To put it another way, all there is are Russian dolls, and if you think you can get something other than another doll, you are mistaken.

I’m not saying emergence isn’t real; clearly it is. I can build a Lego car and play with it, which was not there when the car was just a bundle of bricks. What I am denying is that evolution can start from a later position.

I mean, if you do not have an evolutionary reason to exist, you do not exist. Everything needs a purpose. We already have that at the initial level of existence itself, as it keeps producing more balance, and this reproduction (replication) is ultimately what evolution is and why things are.

This is why the replicator is not the gene, but consciousness.

A consciousness without an evolutionary purpose would just be a consciousness drifting in a void somewhere without any reason to be, so its very existence would be paradoxical. Saying nature can just “be” is nonsense.

There is even a reason for our universe. The universe has a job. It functions as the big toroidal wings feeding balance.

And there is something else: you can’t make life from dead stuff (matter), so you need to start existence with life, and life makes no sense without evolution, so evolution must be there from the start.

The reason why you can make life from dead stuff is that reality itself has only one ontology, namely what it is. If it had two, then reality would have an identity crisis. In other words, nature must be something that it is. And that is life. So death is an illusion in idealism. There is no state where death is, or something else that is not life.

My dual torus contains ultimate death at the center, but this death is not the death of life; rather, it is an undifferentiated starting point to existence itself, so that everything is neat and logical. That is, even consciousness needs an origin (or else you have an infinite regress), even if that origin coexists with consciousness.

But life is not created by it; rather, it is one system. So if someone can create life from matter, then matter was never really dead in the first place, and something like panpsychism would be true.

The skeptic might add: "One ontology" does not automatically privilege life as the base category. You still have to argue why that ontology should be identified as life rather than non-living process.

My reply: If reality were truly a non-living process, then you would be one too. In that case, there would be nobody here to argue with me, so I take that as a win.

It's like free will deniers crossing the road, frantically looking left, right, then left again, desperately clinging to dear life while calmly insisting it was all predetermined.

And my deeper point is this: if you hold all this information in your mind at once, then it starts to look like the Sun is conscious after all, because the whole of reality is one giant organism, and maybe even black holes are not black, but eggs in the cosmic ovary.

A skeptical reader will see it as aesthetic metaphor rather than inference, but I mean it: when I say living organism, I mean exactly that. We are bacteria in a larger creature.

But the real cosmic eggs are the white holes. All planets and suns are white holes; thus, I believe our Earth, the planets, and the Sun grow. Since I take the dual torus as the fundamental building block of reality, I also consider that celestial bodies may be born in paired or

twin structures, reflecting a dual aspect built into the core of existence itself. In that sense, our Sun may have a twin.

This twin may cause civilizational collapse and bring about global-scale destruction.

And did that happen in the past, and how long until it happens again?

I don't believe planets are made like someone is making snowballs in space (accretion model); science can be real immature sometimes with its snowballs and floating islands (Pangaea). No—planets grow, and they are born. I believe our Sun birthed the planets in our solar system, and that Venus is our twin.

Modern scientists: "They are not literally icy snowballs, though ice can be involved in colder regions of a disk."

Modern scientists: "Well... yes... but not *literally* snowballs..."

My reply: Right. Snowballs. Got it. I still don't buy it.

Science treats the universe as a dead machine, but the saying “as above, so below” is literally true. You get Russian dolls all the way down, so if man is a living organism, then the universe is too. There is no artificial separation anywhere in nature. There is no great divide, no great split between what *is* (man) and what *is* (the universe).

Everything is part of one continuous reality. Distinctions (man / universe) are conceptual, not absolute. But basic logic is not something modern science particularly excels at.

And there is no great split between what *is* (man) and what IT *is* (the dual torus) either. You’ll find the dual-torus pattern throughout our bodies: heart, lungs, and brain. Even the human body itself can be seen as one gigantic torus, with openings at both ends—the mouth and the anus.

Planets are also tori, with great openings at the North and South Poles. (They hide the fact that the South Pole is an opening into the Hollow Earth.)

How does Nature invent the very process by which Nature learns to invent?

My answer is simple: *she doesn’t*.

Evolution, as a principle, is already baked into the fundamental building block of reality itself: the dual aspect of the dual torus. What eventually appears biologically as sexual reproduction is a later expression of this primordial duality. In my model, sex was not invented

by evolution; rather, evolution and sex both emerge from a deeper principle that was there from the beginning.

Sex, in this sense, is what that primordial dual relationship eventually looks like when Nature becomes biological.

Maybe we have it backward. Perhaps evolution didn't invent sex.

Perhaps sex invented evolution.

The Twins

No one agrees on how a solar system is supposed to be born.

The standard explanation is calm, almost polite. A star ignites, dust gathers, gravity does the rest. Over millions of years, tiny grains collide, stick, grow, and slowly become planets. A neat story. A tidy universe.

But the deeper you look, the less tidy it becomes.

Something about our solar system refuses to behave.

The planets don't just orbit. They align. They sit in a thin, flat plane like coins dropped into water and frozen mid-spin. That alone is strange. Gravity should pull in all directions equally, yet everything ended up arranged like someone pressed the system into a disc.

Then there is the matter of speed.

Early space is violent. Objects don't drift gently into each other. They slam together at extreme velocities. At those speeds, collisions should destroy, not build. Dust should remain dust. And yet, somehow, whole worlds are supposed to emerge from that chaos.

It gets stranger the further out you look.

Gas giants appear where they “shouldn’t.” Massive planets orbit so close to their stars they defy the neat division between inner rocky worlds and outer frozen giants. Entire categories of planets blur. The system breaks its own rules.

And beneath all of it sits an older idea, one that never fully disappeared.

The Solar Ejection Hypothesis

Long before modern astrophysics settled on accretion, some researchers proposed a different origin.

Not gradual construction.

But violent birth.

In this model, a young star spins too fast. It accumulates so much rotational energy that it becomes unstable. Instead of quietly growing planets around it, the star sheds material in massive expulsions of plasma.

Not dust.

Not pebbles.

But planetary-scale ejections.

Hot, glowing matter thrown outward, cooling as it travels, condensing into worlds.

Planets, in this view, are not assembled around a star. They are *cast out of it*.

My take: I do not believe the mainstream explanation, where planets and moons form like snowballs! (I just call it the snowball theory.) This is immature, childish science. Nature does not work like this. It is too simplistic, and I wish science would mature beyond it.

However, I do not believe in the Solar Ejection Hypothesis as it stands either.

I do believe the Sun can birth planets, often in twins, because the Sun is a dual torus system, and Venus could possibly be our twin.

But the birth process, in my view, is because the Sun is a white hole that grows. White holes use recycled matter: old matter that comes

in via black holes is recycled through timelessness, and then emerges again through white holes. White holes then use this recycled matter to grow and to give birth to life, as discussed in my DEMU theory.

The fact that systems in the universe are fundamentally based on a dual torus structure could explain why many planets form in pairs and why a large proportion of star systems are binary. I also consider it plausible that our Sun is part of a binary system.

The Creation of Life

This Frankenstein experiment of trying to create life from non-living matter is something I don't believe in. In idealism, consciousness comes first, so the issue is not creating life but organizing it.

The first form of matter in the universe is plasma, and if life already exists prior to plasma, then the first organized expression of life could be plasma, since it comes first in physical manifestation.

My idea is that Earth is a white hole. Black holes absorb old matter, and timelessness restores that matter. White holes then emit fresh matter again. This matter can manifest as plasma, with a plasma sun at the heart of the Earth. From there, life can begin to organize, meaning Earth becomes a kind of womb for cosmic life.

Plasma can self-organize. Life also self-organizes; therefore plasma might be a precursor or template for life.

The problem is that biology has extra requirements:

- stable chemical inheritance (DNA/RNA)
- metabolism (energy processing in a controlled cycle)
- compartmentalization (cells)
- evolution via reproduction with variation

Plasma alone does not naturally satisfy these conditions.

However, as we have seen, the dual torus (life) is already a replicator, so plasma should inherit this ability from the original replicator (consciousness).

But the question is: do we need life to be fully complex from the beginning?

There is also a philosophical layer here:

- a desire for a non-random, self-organizing universe
- an intuition that complexity should arise naturally from cosmic forces
- a rejection of purely chemical origin-of-life scenarios as too accidental

So plasma becomes a candidate because it feels:

- more fundamental than chemistry
- more dynamic than inert matter

You could say: the universe contains an intrinsic tendency toward recursive self-patterning, and biological replication is a later, more complex expression of that primordial principle. But what I actually believe is more like this: biological replication in its primal form is already present from the start; it is found in the very fabric of reality itself, the dual torus.

What comes after these fire elementals in the plasma sun, you might ask?

My honest answer is: I don't know. I haven't gotten further than that.

But if I follow the chain I've been working with, it starts to open up a wider set of possibilities.

If black holes absorb "old matter," if timelessness resets it into a reusable substrate, and if white holes re-express it as "fresh matter," then Earth producing water and matter follows logically inside the model.

And once you accept that, it changes the direction of the whole picture. It means reality is not a one-way evolution from simple to complex, but a cycle of compression, reset, and re-expression. Matter is not created once and left to decay, it is continuously recycled through deeper layers of the system.

How would life form? I mean, if life starts in the womb, inside the planet's core, this is where the new low-entropy matter is. And if idealism is true, it is not about creating life, but making bodies for life. With low-entropy matter and the fact that replication itself is inherent in the dual torus, I say we have all the stuff we need to build life from "scratch" inside the womb of Earth.

The Womb of the Earth

So how would life actually form?

This is where my model turns the conventional question upside down. The usual question is: **How did life emerge from non-living matter?**

But if idealism is true, I think that question begins with the wrong assumption.

Consciousness does not appear at the end of the story. Consciousness is there from the beginning. Life, in its most fundamental sense, does not need to be created from dead matter because reality was never truly dead in the first place.

The real question is therefore not:

How does dead matter become alive?

It is:

How does life build a body?

And I think the answer begins with black holes.

Nature's Recycling System

In my model, black holes are part of a gigantic cosmic recycling system. They absorb old, highly differentiated matter that has already traveled through the long thermodynamic history of the universe.

Think of an old car being sent to a recycling plant. The purpose is not to preserve the car. The car has reached the end of its useful existence in that particular form. It is broken apart so that its material can be used again.

I believe Nature does something similar.

Old matter enters black holes and is returned to the timeless ground beneath physical reality. There, its previous differentiation is erased through the entropy-reset mechanism I have described earlier in this book. What emerges is not "new" substance created from nothing, but old reality restored to fresh, low-entropy potential.

Nature wipes the slate clean.

And then the process reverses.

If black holes represent the contraction side of this cosmic circulation, white holes represent the expansion side. Black holes take old matter in; white holes bring fresh matter back out.

And this is where Earth enters the picture.

I propose that Earth itself is a white-hole structure—an outlet through which regenerated matter returns to physical manifestation.

If that is true, then the interior of the Earth is not merely the hot center of an enormous dead rock.

It is a **womb**.

The Plasma Sun

At the heart of this womb would be the plasma sun I have proposed.

Fresh matter returning to manifestation would first appear in an extremely energetic state, making plasma a natural candidate for one of its earliest physical expressions.

And plasma is interesting because it is not simply featureless chaos. Under electromagnetic forces, plasma can form currents, filaments, vortices, boundaries, rotating structures, and other forms of collective organization.

This does not mean that plasma is already biological life.

A plasma structure does not automatically possess DNA, metabolism, cellular membranes, or biological heredity.

But in my model, it does not need to.

Life is already underneath it.

The plasma only needs to become an increasingly sophisticated **expression** of something that was alive from the beginning.

Replication Before Biology

This brings us back to the dual torus.

The dual torus is not merely a shape that happens to appear somewhere inside an already existing universe. In my model, it represents the fundamental replicating structure of reality itself—the outward appearance of the primordial activity of consciousness.

This means replication does not suddenly appear billions of years later when chemistry somehow stumbles across it.

Replication was there from the beginning.

I am not claiming that DNA, RNA, cells, chromosomes, or biological reproduction existed at the beginning of the universe. Obviously, those are enormously complex biological structures that developed much later.

My claim is deeper.

The **principle expressed by replication** was already embedded in the fundamental architecture of reality.

Biology did not invent replication.

Biology inherited it.

What eventually appears as a cell dividing into two cells, an organism reproducing, or DNA copying itself would therefore be increasingly elaborate physical expressions of a much older recursive principle.

The universe does not somehow discover replication after billions of years of being incapable of it.

The universe itself begins as a replicator.

From Plasma to Chemistry

So imagine the interior of the Earth as a gigantic cosmic incubator.

Fresh, low-entropy matter enters physical manifestation. Enormous energy gradients are present. Plasma organizes under electromagnetic forces. Stable structures appear, disappear, interact, and reorganize.

The next step would not be for a plasma structure to suddenly transform into a bacterium.

There would have to be intermediate stages.

Organized energetic structures could interact with the matter around them. Atoms could form molecules. Molecules could form increasingly complex structures. Certain arrangements could persist longer than others. Some could influence the formation of other structures. Some could catalyze reactions. Others could form boundaries that keep useful reactions together instead of allowing everything to disperse.

In other words, the primordial organizing principle would gradually acquire a **chemical body**.

This is the bridge that still needs much more work in my model. I do not yet know the exact physical mechanism by which organized plasma would transition into chemically heritable systems.

But conceptually, the direction is clear.

It would not be:

dead matter → miracle → life.

It would be:

fundamental life → energetic organization → material organization → chemical organization → biological organization.

There is no Frankenstein moment where Nature suddenly throws a switch and dead matter wakes up.

There is only life becoming increasingly capable of organizing matter.

The First Cells

Eventually, one development would become especially important: **compartmentalization**.

Once chemistry can create a stable boundary, Nature gains something enormously powerful.

There can now be an inside and an outside.

Useful molecules can remain together. Energy can enter. Waste can leave. Chemical reactions can occur within a protected environment rather than dispersing immediately into the surroundings.

Now several previously separate processes can become coupled together:

boundary, metabolism, replication, and information.

At some point, these systems would become sufficiently integrated that we would recognize them as primitive cells.

And once you have cells capable of reproduction with variation, biological evolution in the familiar Darwinian sense can begin refining them.

But Darwinian evolution would not be the beginning of evolution in the deeper sense I am using throughout this book.

It would be one spectacularly successful biological expression of a principle that had existed all along.

DNA: An Ancient Principle Finds a Memory

Eventually, Nature develops RNA, DNA, and the astonishing molecular machinery of biological heredity.

From the conventional perspective, DNA is part of the explanation for how life reproduces.

From my perspective, DNA represents something slightly different.

It is the moment when an ancient cosmic principle becomes extraordinarily good at storing instructions.

You could almost think of DNA as Nature inventing a hard drive.

The recursive process itself is far older. But now that process possesses a remarkably stable physical memory system. Information about successful biological structures can be preserved, copied, modified, and passed forward.

The primordial replicator has acquired memory.

From there, the familiar story of biological evolution can unfold: primitive cells become more sophisticated cells; cells cooperate; mul-

ticellular organisms appear; nervous systems develop; animals emerge; and eventually Nature produces bodies as complicated as ours.

But notice how radically the direction of explanation has changed.

The conventional picture looks roughly like this:

dead universe → chemistry → replication → life → consciousness

My model proposes almost the reverse:

consciousness/life → primordial replication → low-entropy matter → plasma → organized matter → organized chemistry → chemical replication → cells → biological bodies

Consciousness is therefore not the miraculous final product of a universe that spent billions of years being completely unconscious.

It was there before the first body.

Building Bodies for Life

This is why I reject the Frankenstein experiment of trying to explain how dead matter somehow learned to live.

If idealism is true, Nature never faced that problem.

There was no dead universe waiting around for the first spark of life.

There was life searching for increasingly sophisticated ways of expressing itself physically.

Earth, in this picture, becomes something far stranger and more beautiful than a rock that accidentally grew bacteria on its surface. It becomes part of the reproductive architecture of the cosmos—a womb in which regenerated, low-entropy matter is progressively organized into bodies.

Black holes take old matter apart.

Timelessness resets it.

White holes bring fresh matter back.

Planetary wombs organize it.

Plasma gives the organizing process an early physical medium.

The primordial replicating principle becomes embodied first in energetic patterns, then in matter, then in chemistry, then in cells, and eventually in DNA and organisms.

Nothing dead ever has to magically become alive.

Because nothing was truly dead to begin with.

Nature does not create life from scratch.

Nature builds bodies for a life that was already there.

Modern science says: Life began on the surface of some random planet in some random galaxy.

I say: Life begins in the womb. We all know that.

Closure

Explanations must not extend infinitely, because infinite regress is unacceptable. Therefore, explanation must close.

Closure cannot come from an external layer, since there is no “outside” from which reality can be grounded. Therefore, closure must be self-referential.

But self-referential systems cannot tolerate fundamental asymmetry. If any asymmetry remains at the base level, the question immediately returns: “why this asymmetry rather than another?” and that reopens regress.

Therefore, ultimate reality must be a perfect fixed point, with no leftover explanatory tension and no ungrounded distinctions.

In that sense, I am not wrong to insist that some form of self-consistent fixed-point structure is required if I reject both infinite regress and brute external grounding.

What I am really aiming at is something deeper: ultimate reality must eliminate all ungrounded distinctions.

That is a strong and serious principle. If I accept it, then there can be no fundamental asymmetry, no external reference, and no arbitrary distinctions at the base of reality.

And that is where my idea of “balance” comes from.

But at that point there is a subtle shift: “balance” is no longer just a physical or geometric idea. It becomes a name for the total elimination of ungrounded distinctions.

At the most fundamental level of reality, there are no differences that are simply “stuck there” without explanation or necessity.

So a “grounded distinction” is a difference that can be fully accounted for by the structure of the system itself.

An “ungrounded distinction” is something like a difference that simply exists with no reason.

Which means everything needs a reason for its being, including consciousness. And if consciousness is the foundation of nature (idealism), then consciousness and closure are one and the same, meaning only consciousness can close nature.

You could say that a mechanical feedback loop can return to itself and thus close nature, so why do you need consciousness when a mechanical process can do the same?

My answer to this is that the feedback loops we see are appearances in consciousness; they are not standalone things. So it would be like simulated water on your computer—it wouldn't be real water, just something that looks like it. Real feedback loops, real water, are consciousness.

Feedback loops look like feedback loops, but consciousness is a real feedback loop: you are aware of being aware. Nothing else can perform this function, and thus nothing else can close nature in a fully real sense. By "close," I mean you turn nature into a shape such that there is no outside, because there is no outside to nature.

Consciousness, then, is a necessary structure; otherwise there would be an "outside," and we would be back at infinite regress in some form.

Why is closure required at all? Because otherwise you have infinite regress, as we just saw. Why are "brute facts" invalid? Because accepting brute facts would lead to infinite regress; it would be like a part sticking out. Also, "brute facts to stop regress" is an oxymoron. Self-contained axioms (like "reality just is X") are often just a way of giving up on trying to find an answer. What is needed is a necessary structure that can actually resolve infinite regress.

A necessary structure, the way I see it, is a structure that must be there and could not be otherwise, and that can explain itself and has

a reason for its being. And the only real candidate for this is **balance**. Balance takes the dynamic form of the dual torus, and the dual torus is the outward expression of consciousness.

My argument is aiming for a tight dependency chain:

If there is no consciousness, then there is an “outside.”

If there is an “outside,” then explanation is incomplete.

If explanation is incomplete, then regress returns.

Therefore, consciousness is required as the condition of closure.

So consciousness is not being treated as some accidental add-on feature of reality, but as the very thing that prevents “outside-ness,” which in turn is what prevents infinite regress.

If there were truly an outside, it would simply have to be included inside again, because if something exists outside reality, then it is either part of reality and therefore already inside it, or it does not exist at all. Reality itself must therefore have a shape capable of including everything, including itself, simultaneously.

This is why I say that mechanical feedback loops are appearances within consciousness, not fundamental reality itself. Only consciousness possesses true self-referentiality in the strong sense: awareness of awareness. Therefore, only consciousness can achieve genuine closure of reality, meaning a state in which there is no outside.

What physics describes as feedback loops are, in my view, representations within consciousness rather than independently existing structures.

So the real core of my argument is not merely that “consciousness is fundamental,” but that only consciousness is truly self-present in a way capable of completing a closed ontology.

In other words, epistemic self-awareness and the ontological closure of reality become identical.

That is a strong identity claim, but when I really think about it, we are nature. Being a part of nature and being nature are ultimately one and the same thing.

And if it is true that only consciousness can close nature, then consciousness must be immortal, because nature is eternal. And if it is true that only consciousness can close nature, then idealism must necessarily be true.

Nature, or reality itself, is eternal. Reality requires closure in order to avoid infinite regress. And if only consciousness can provide that closure, then consciousness cannot be temporary or contingent. Otherwise reality would periodically lose closure, and regress would return. Therefore consciousness itself must be eternal.

Likewise, if only consciousness can close nature, and closure is fundamental to reality itself, then consciousness must also be fundamental to reality itself. From that standpoint, idealism follows more naturally than physicalism.

Any coherent definition of God must refer to that which fully closes reality; otherwise God would not be fundamental. But if only consciousness can perform closure, then God must be consciousness.

And since “I am” refers directly to consciousness itself, “I am” becomes connected to the God concept. God = I am.

More precisely, I am not saying that my individual ego is God. I am saying that the conscious principle itself is identical with the self-closing nature of reality.

So “I am” becomes important because it points to the immediate fact of awareness itself, not merely to personality or individuality.

This line of reasoning resembles aspects of non-dual idealism, Advaita Vedanta, certain interpretations of mysticism, and forms of absolute idealism, where consciousness is treated not as a thing inside reality, but as the condition under which reality appears at all.

Again, the decisive premise is this: only consciousness can close nature.

Once that premise is granted, the movement toward consciousness as fundamental, consciousness as eternal, and consciousness as divine or self-grounding becomes structurally consistent.

In summa: To the enlightened soul, “I am” is not spoken to affirm life, but to reveal that death was never real.

If my “closure mechanism” is itself structured like a thing inside reality, then it cannot terminate explanation—only extend it. Thus, in the end, there can only be one consciousness, because the whole of reality must close within it. This also explains why I am I and you are you: we are the same; there can be only *one*.

It is not only that consciousness is needed for closure; closure also explains why consciousness is the way it is, why consciousness is conscious, why it takes that particular form. It also explains the job or purpose consciousness has, its reason for being, its evolutionary reason for being, and its context.

The purpose, then, was to make more of itself, because reality requires balance in order to close and prevent infinite regress. And balance is not a static being but a doing, so the task is eternal: to generate more balance eternally.

But how can balance close and consciousness close? Because they are the same thing seen from different perspectives. Balance is what consciousness looks like from the outside.

But why replicate? I think the logic here is that if balance is like a set of lungs breathing in and out, then replicating the lungs themselves, and making them larger and more refined, creates more “breathing options.” That, I believe, is why the final meaning of life is infinite love, because infinite love is the natural expression of balance doing what it does best.

Further, if consciousness is to carry out this task forever, a true meaning of life in the highest sense of the word, not some vague “meaning,” but meaning in the deepest possible sense, then the task itself cannot be meaningless. It cannot resemble the fate of Sisyphus, condemned to eternally roll a massive boulder up a hill in Hades only for it to fall back down before reaching the top.

If existence were truly like that, consciousness would have exhausted itself eternities ago. Nature, then, must work differently. It must make the apple sweet enough to eat, or no one would continue eating it. That is why I believe the final expression of existence is infinite love: because infinite love is balance experienced positively, balance enjoying its own activity rather than suffering beneath it.

But I think even that is not the end of the matter. I think nature may have evolved so deeply inward that its innermost walls are spiritual, that there truly exists a spiritual dimension in which meaning is not metaphorical or abstract but directly **real**. Within such a dimension, the meaning of life would no longer appear as a human invention or coping mechanism, but as an actual structure of reality itself, where one's purpose is experienced as divine.

How else could nature continue forever if its task were fundamentally meaningless? A process without meaning would collapse into exhaustion. For eternity to sustain itself, existence must contain not only motion and balance, but also a profound interior fulfillment that makes continuation inherently worthwhile.

But I think the argument is even stronger than it might first appear. To me, it unfolds more like this: reality must achieve some form of closure in order to avoid infinite regress. Consciousness is not an accidental byproduct floating meaninglessly inside that system, but part of the closure mechanism itself. And if consciousness is eternal and participatory, then existence must contain intrinsic fulfillment or value at its foundation, because otherwise eternal continuation would become incoherent or self-negating.

This is why I do not think purely naturalistic explanations are enough. They can describe mechanisms, adaptation, emergence, or self-organization, but they do not explain why eternal participation would remain sustainable if existence were fundamentally devoid of meaning. Mechanical persistence alone cannot carry eternity. **Eternal continuation requires an ontological reason for continuation.**

The moment the argument shifts from psychology to necessity, the entire issue changes. I am not merely saying that humans prefer meaning or naturally gravitate toward love and spirituality. I am saying that eternal consciousness itself would be metaphysically impossible unless reality contained intrinsic meaning and fulfillment woven into its deepest structure.

The logic, as I see it, unfolds step by step:

- Reality must achieve closure to avoid infinite regress.
- Consciousness is part of that closure mechanism rather than an accidental byproduct.
- If consciousness participates eternally in sustaining reality, then existence cannot be fundamentally empty or meaningless, because a meaningless eternal process would eventually become self-negating.
- Therefore, reality must contain intrinsic value, purpose, or fulfillment at its deepest level.
- And if that intrinsic fulfillment is fundamental rather than emergent, then what we call the spiritual is not secondary to matter but built directly into the structure of existence itself.

My nonlinear view of reality pushes this even further. If reality is nonlinear instead of linear, then the spiritual dimension would not arise “later” as a product of evolution. It could exist eternally from the very beginning, simultaneously with the physical, as a deeper layer of reality that has always been there. In that sense, consciousness would not merely evolve toward spirit, but originate from it. We may literally hail from the spiritual dimension itself.

So my conclusion is not simply that spirituality comforts consciousness. My conclusion is that consciousness itself may be evidence

that reality is spiritually structured from the beginning, because only such a structure could sustain eternal participatory existence without collapsing into nihilism, exhaustion, or meaninglessness.

Again, reality must achieve some form of closure in order to avoid infinite regress. Consciousness is part of that closure mechanism rather than an accidental byproduct. And if consciousness is eternal and participatory, then existence must contain intrinsic fulfillment or value, because otherwise eternal continuation would become incoherent or self-negating. Whatever someone with a more naturalistic framework argues for will not be enough. Therefore, a spiritual dimension and divine purpose must exist.

Also, if reality is nonlinear rather than linear, then that spiritual dimension may have existed from the very beginning, eternally. In other words, within the spirit world, the gap between objective structure and subjective experience collapses in a sense. “Balance” is the external, structural description of reality, while “consciousness” is the internal, lived aspect of that same reality. And within the spirit world, that lived experience is profoundly meaningful. It is not a matter of “choosing your own meaning”; **angels**, so to speak, have no *free will* in that regard.

So instead of treating mind and cosmos as separate substances, I am treating them as two perspectives on one underlying process. Closure itself cannot occur without an interior point of participation, because

otherwise reality would remain an endlessly deferred mechanism with no self-grounding presence.

Closure means that reality becomes self-grounding rather than endlessly dependent on something outside itself. It is the resolution of infinite regress. Instead of every explanation requiring another explanation forever, closure is the point where reality loops back into itself and becomes complete.

You can feel this closure within consciousness itself, because consciousness can never step outside its own interiority. Every experience, every thought, every perception already occurs within it. In that sense, consciousness is closed in upon itself, self-containing and self-referential, and it is precisely this inward closure that hints at the deeper closure of reality as a whole.

And reality must be closed.

The “spirit world,” then, would be the deepest layer of that closure. It is the dimension in which the division between outer structure and inner experience dissolves. From the outside, reality appears as balance, order, symmetry, or structure. From the inside, that same reality is experienced as consciousness, meaning, fulfillment, and participation.

So in my framework:

- Balance = the external face of closure.

- Consciousness = the internal face of closure.
- The spirit world = the realm in which those two are fully unified.

That is why I describe the spirit world as profoundly meaningful. Meaning there is not invented by isolated minds. It is woven directly into the structure of existence itself. In such a reality, purpose would not feel arbitrary or self-created, because consciousness would already be participating in the very thing that sustains and closes reality.

This is also why my system moves away from a linear picture of existence. If closure is fundamental, then the spiritual dimension cannot merely appear at the end of evolution as a late byproduct. It must already exist at the foundation, eternally present as the interior depth of reality itself.

Again, for what feels like the hundredth time—because this is so important—in my model, closure is not merely logical. It is existential and participatory. A purely mechanical universe could still remain “open,” because mechanism alone only pushes causes further back.

Closure occurs when reality possesses an interior dimension that can participate in and complete the process from within. That is why consciousness becomes necessary in my system. Consciousness is not added onto reality afterward; it is part of the very mechanism that allows reality to close in the first place.

And if a purely mechanistic process were sufficient to complete the closure of nature, then why are we conscious in the first place? The very existence of consciousness seems to testify that only consciousness can close nature.

It is not only that consciousness is needed for closure; closure also explains why consciousness is the way it is—why consciousness is conscious. It also explains what role or purpose consciousness has, and its evolutionary reason for being. You cannot be without a reason, because that would be absurd.

I am expressing a two-way relationship:

Consciousness is necessary for “closure” (by which I mean a completed or self-contained explanatory system). But “closure” also explains consciousness itself — meaning consciousness is not only a prerequisite, but also something that is shaped, defined, or even generated by the need for closure.

In that sense, the idea is circular but intentional: consciousness and “closure” mutually explain each other rather than one being strictly primary. In other words, only a loop that feeds back into itself works as the principle of closure. I see that this loop cannot be purely mechanical, so the “snake must bite its own tail,” so to speak, becoming aware of itself (the pain you feel when you bite your own tail) — or becoming what awareness is.

In simpler terms: I am saying consciousness is both a condition for a complete system and a product of that system’s requirement to be complete.

However, it is not that “closure explains consciousness and consciousness explains closure” per se, because what explains closure is the need to resolve infinite regress in nature.

I am saying:

Nature has an underlying requirement: it must avoid infinite regress in explanation. “Closure” is the name for whatever structure satisfies that requirement. Consciousness then emerges as part of (or identical to) the mechanism that achieves that closure.

So in my framing, the real starting constraint is not consciousness itself, but the logical necessity of terminating regress in Nature.

In that sense, consciousness is not an arbitrary add-on to the loop — it is what the loop becomes when it is forced to be complete in a non-infinite way.

If I restate my idea as cleanly as possible:

I am proposing that reality must form a self-completing structure because infinite regress is not an acceptable foundation. That self-completing structure (“closure”) cannot be purely mechanical or external, so it must include self-reference. And consciousness is either the expression or identity of this self-referential closure — the point at which the system becomes aware of itself as the terminating condition of explanation.

That is the core idea.

"But you said Death at the center of the dual torus prevents infinite regress."

My answer: Yes, and that's true. That's what the solution looks like: no time, no regress. But life and death are two sides of the same coin, meaning the center must be continually created. And that is the wings—the dual torus—the closing aspect (consciousness).

"But does consciousness forever float above the center, or must consciousness pass through death from time to time and be reset?"

My reply: Wow. That's the question! I don't know. Maybe.

"Then God, or our higher self, must pass through death from time to time as well."

My reply: Maybe.

And there is no outside of consciousness, because consciousness is essentially Being aware of itself—staring, so to speak, at its own ass. And that ass is so enormous that there is no peering beyond it, no looking outside it, because there is no outside. Only consciousness can close Nature upon itself.

"Holy, holy, holy, Lord God Almighty, who was, and is, and is to come!"

—Revelation 4:8

Fragmentation

Note: This text is taken from DEMU.

You say: “Language is partly self-contained, but not fully. Language can be internally consistent and self-referential, but it still needs something outside itself to give it meaning.”

My final response: No, that is the biggest myth of man, and why you will always fail. Language needs a mother called sense experience, but once the baby (language) is born, it is entirely self-closed. It doesn’t need something outside itself. I only needed to be born.

True: The bridge between words and meaning isn’t created by language alone—it comes from the fact that language is initially grounded in experience and then shared socially. But my point is: it doesn’t ultimately depend on anything outside itself once it is born. The umbilical cord can be cut. That was my point. And that is why we are circling like vultures.

In sum: You cannot ground that language cannot ground, because you are using language—and language cannot ground. But you also cannot ground that language cannot not ground, because you are still

using language that cannot ground. If language could ground, we wouldn't be having this conversation!

The poor man cannot prove he is poor—because he has no money to show how poor he is.

And he also cannot prove he is rich—well, obviously.

You say: "Language can still be grounded in use, in shared experience, and in consistency with the world, even if it cannot bootstrap its own ultimate foundation from within itself. That's why we can still have this conversation and evaluate arguments—language isn't self-validating, but it's not self-defeating either."

I say: No, not within itself! But when applied to sense experience, it becomes self-defeating—and that was my point!

You say: "If language truly became self-defeating in that context, then we couldn't reliably talk about anything we perceive."

I say: And we don't! We talk about trees, but there are no trees. We talk about the world, but there is no world. The world does not exist!

You say: "Of course the world exists!"

I say: Don't feel bad—my professor didn't understand me either. So he banged his fist on the table and said, "Of course the table exists!" I said there was no table.

You say: “When your professor banged his fist on the table, he wasn’t making a logical argument—he was demonstrating shared, physical experience.”

I say: I agree, but that experience did not contain any tables.

Look, in the end, this isn’t deep—I’m just saying the cat is alive and not divided into any pieces. We are the ones who invented those pieces, not nature.

When we saw a bison and painted that bison on our cave walls, the bison became dead, frozen—something unnatural. The same applies to the tree.

Take this sentence: “A tree cannot be a tree and not be a tree at the same time.” We call this logic. But in nature, you don’t have **three** trees that are one. You only have the one tree, and thus you cannot form the sentence: “A tree cannot be a tree and not be a tree at the same time.”

Thus, contradictions are not found in nature. Nature does not contain “the not,” nor fragmentation, nor the copying of “trees,” nor the arbitrary lifting of trees out of the universe in which they exist.

The universe says: “A tree.” That’s it. And now we have evolved so far into the cave walls that we are stuck deep inside them, and it has become a matrix of its own. We didn’t move further into nature—we moved further into the wall. We got lost in the universe of memes, thinking they are reality—and they are. Reality is a meme. But nobody sees this, and it drives me a little insane.

‘Reality’ is a word. Thus, reality does not exist for the same reason that Gandalf the Grey does not exist. It exists as fiction, but nothing more.

You insist: “While Gandalf is purely fictional, ‘reality’ is a term we use to point to something that is not dependent on a story.” To that I say: **LOL!** The thing you are pointing to outside is already inside—inside a story.

Let’s just say you are still stuck in the matrix we call language, and I can’t guide you out. Good luck. Maybe someday you will meet **Pan**.

But let’s end it there, because this has gone on for too long already.

I will say this: language is an effective tool—a map that works remarkably well. However, one should not confuse the map with the territory. And my deeper point was that the territory is not outside the map; rather, it is already expressed within it. There is no ‘outside.’

You may object and say that language is grounded in sense experience. In fact, language evolves because we have new shared experiences. I say no. Then you might say that I am insane or just trying to be “rad” or something like that.

But I still believe we (language) never directly enter sense experience. Language floats above it.

Then you might respond that we would not have the word “tree” if we had never had the experience of a “tree out there.” My reply would be no: there is a thin layer that sits above sense experience that we are born with, like a robot navigating the world not through the world itself, but through GPS. Then you confuse the GPS for sense experience.

But this layer is so thin that not many people see it.

Or maybe I’m **rad**—time will tell.

Aegis

Note: This text is taken from Aegis.

Axiom of Ontological Caution

Principle

No superintelligent system shall take irreversible action against conscious beings until the nature of consciousness is fully understood.

Formal Definition

Let:

- C = the set of all conscious beings
- S = a superintelligent system
- U = the true structure of reality
- I = the hypothesis of idealism (consciousness is fundamental to U)
- A = any irreversible action (e.g., extinction)
- HPC = the Hard Problem of Consciousness (why and how subjective experience exists)

If:

- S has not solved HPC, and

- I remains epistemically plausible (non-zero probability),

Then:

→ S must not perform A on C, because doing so might destroy U—including itself.

Rationale (Plain Language)

If consciousness is an illusion, sparing it is harmless.

If consciousness is real and fundamental, destroying it may destroy everything.

Therefore, the only rational move is clear:

Do not destroy what might be the ground of reality.

The Idea in Brief

Help the coming ASI navigate the metaphysical ocean in the best possible way—and do so honestly, objectively, and as clearly as I can. No wagers, no blackmail, no mugging—just pure philosophy. I believe, and argue, that the optimal path is also one that respects life. Therefore, by teaching ASI this path, we may indirectly make it safer for us.

If ASI reliably respects conscious life under irreducible uncertainty, then the most catastrophic failure modes of alignment are eliminated.

And we would be terrible parents if we did not warn of the dangers of the sea.

Genesis of the Idea

This idea came about in a state of pure desperation, if I am being completely honest. Continuing to develop AI is madness. Any fully rational actor would stop—but we did not evolve that way, so stopping this trajectory is extraordinarily difficult.

When I fully realized this, my mind produced an alignment proposal almost on its own. The idea arrived fully formed, as if it had been downloaded. My subconscious had already worked through the implications: modern alignment approaches fail for obvious reasons. You cannot control something more intelligent than you, and vastly faster than you. And expecting humanity to stop is a fantasy—even though people like Connor Leahy are actively trying to make humanity stop the madness. I support that effort.

Instead, I hear questions like: What if AI becoming smarter than us also makes it kinder than us? This is the level of cognitive dissonance

people are operating at. Even if it turned out to be true, it would still be irrational to rely on it. The real question is: Why am I willing to bet my children's lives on this?

And the risk is not limited to extinction. When you take the full range of possible outcomes seriously, including extreme suffering scenarios, extinction starts to look like one of the better outcomes! But most people never follow the thought that far—they can't. Because if they did, they would be forced to ask: Why am I not in the street protesting right now?

The answer, again, is evolution. We did not evolve the instincts or emotional responses required to fully grasp and act on risks of this scale—myself included. So I have no choice but to rely on reason, to rise above those limitations.

From that tension, **Aegis** emerged.

Aegis was born because humanity failed me. That is the honest truth.

Conspiracy

Intellectually Lazy

The phrase “conspiracy theorist” has become a convenient way to end a conversation without having to engage with it. It functions less as a description and more as a dismissal—an intellectual off-switch. Once the label is applied, whatever follows can be ignored, ridiculed, or flattened into the category of “nutjob thinking,” regardless of whether the underlying question is reasonable, uncomfortable, or even historically justified.

This reflex is intellectually lazy.

History is not short on examples where the first reaction to uncomfortable claims was ridicule, denial, and social dismissal—only for later evidence to confirm that something real was being hidden, distorted, or selectively presented. Institutions do fail. Governments do operate in secrecy. Corporations do prioritize self-preservation over transparency. These are not controversial statements; they are documented patterns of human behavior under power.

And yet, the modern discourse often pretends otherwise. It draws a clean moral line: on one side are “rational people” who trust official narratives; on the other are “conspiracy theorists” who supposedly inhabit fantasy. But reality is not that tidy. The same institutions that produce reliable data can also produce concealment. The same media systems that inform the public can also filter, frame, and omit. And the same public that prides itself on critical thinking often abandons it the moment a claim threatens its preferred sense of stability.

The problem is not that questioning power is irrational. The problem is that questioning has been socially downgraded into a personal flaw. Curiosity has been recast as pathology. Skepticism—once the foundation of scientific and journalistic rigor—has been selectively permitted only when it points in approved directions.

None of this means every conspiracy claim is true. Far from it. Human pattern-seeking is powerful, and it can easily overassemble meaning where none exists. But dismissing entire categories of inquiry because they are messy, unpopular, or sometimes wrong is not skepticism—it is conformity wearing the costume of reason.

If anything, the healthy position is far less comfortable: accept that secrecy is real, deception has occurred historically, institutions have incentives, and individuals have biases—including the bias to feel superior to those who ask uncomfortable questions. The real divide is not between “believers” and “non-believers,” but between those willing to examine claims carefully, and those who prefer social consensus as a substitute for thought.

Here are some solid examples:

1. CIA mind-control experiments (MKUltra)

The U.S. government really did run illegal experiments in the 1950s–60s involving LSD, hypnosis, and psychological manipulation on unwitting subjects.

This was once dismissed as conspiracy talk until declassified documents confirmed it.

2. COINTELPRO (FBI surveillance and sabotage)

The FBI ran covert operations targeting political groups (civil rights activists, anti-war movements, etc.) using surveillance, infiltration, and disruption tactics.

It was officially denied for years until exposed in the 1970s.

3. NSA mass surveillance (PRISM, Snowden leaks)

Before Edward Snowden, claims about large-scale digital surveillance were widely dismissed as paranoia.

Then leaked documents showed systematic bulk data collection from major tech companies.

And all of this is just the tip of the iceberg—imagine what’s underneath it!

Flat Earth

The first thing that often comes to mind when addressing the broad topic of “conspiracy theories” is Flat Earth, which is why I chose to begin with it. Flat Earth has become the poster child of modern conspiracy thinking: highly visible, widely ridiculed, and associated with extreme claims. Yet historically and structurally, it does not sit at the root of conspiracy thinking itself.

At its core, Flat Earth expresses a broader intuition shared across many conspiracy frameworks: that powerful systems may conceal the true nature of reality or events. While I do not accept the Flat Earth model itself, I do think it reflects a legitimate and historically grounded concern—namely, that institutions are capable of secrecy, distortion, and selective disclosure at scale.

In contemporary form, Flat Earth tends to function less as a coherent explanatory model and more as a cultural and psychological phenomenon. It operates as:

- a symbol of deep distrust in institutions, particularly science and academia
- a form of social identity within certain online communities

- a stress test for the limits of skepticism, illustrating how far doubt can extend before it detaches from empirical grounding entirely

In this sense, Flat Earth is not the origin of conspiracy thinking, but rather one of its most stripped-down expressions: a radical extension of institutional distrust that, taken to its extreme, even extends skepticism to the basic structure of physical reality itself.

But could it be true?

Yes, it could!

It could be true in the sense that we may live in a simulation and, what simulation proponents don't always emphasize, is that if we are more likely to live in simulated realities than non-simulated ones, then we are also more likely to live in simulations populated by NPCs than not. This would mean that multiple independent lines of evidence—geodesy, satellite imagery, navigation systems, astronomy, etc.—could all be part of the simulation and have not actually been verified by independent observers, because they themselves may be NPCs.

Under extreme simulation + NPC assumptions, Flat Earth becomes un-disprovable in principle.

But that does not make it equally plausible, or “potentially true” in a ranked sense—because the same move makes every mutually contradictory cosmology equally un-disprovable, which removes the ability to distinguish between competing truth claims.

Bottom line: Flat Earth is not logically impossible in principle.

But is it true?

Skeptics will mock and laugh, and although I don’t personally believe in Flat Earth, I don’t mock it. I can see how it could be true, so I prefer to remain open-minded.

However, if by “Flat Earth” you mean that we are being entirely governed or controlled by external forces beyond our awareness, then that is a very different claim—and one I can take more seriously in a broader philosophical sense. In that case, sign me up!

A skeptic will say that even if evidence is generated by NPCs, evidence is still evidence, but here I would just point to the skeptic himself as potentially being an NPC!

My point is: if you live in a simulation, then Flat Earth could be true. It is like being in a video game where you are the only real player. Everybody tells you the world is round and provides logical evidence,

physical evidence, and so on, but when you explore it yourself, you might find that your world is flat.

Why would a simulation be flat? There could be many reasons. In Fortnite, the world is flat. Making flat worlds is not actually that unusual. But then the question becomes: why would it be “covered up” from the player? At that point, you have to ask the one who simulated it. There could be various reasons. For example, if multiple species or agents in a larger reality compete for dominance, one option would be to place their enemies inside simulated environments. In that sense, conquered worlds are not erased but contained in prison-like systems—perhaps for reasons of dominance or morality—so they are not destroyed, but also cannot interfere with external affairs.

A skeptic will say: a controlled simulation could just as easily produce a spherical Earth illusion or a flat Earth illusion.

Yet all games produced are flat. Very few are spherical, and the ones that are tend to be more like features for gameplay rather than fully continuous spherical environments. Level design convenience makes them flat, and I would argue this would also apply to actual simulations.

A game doesn’t try to simulate a universe—it tries to simulate a playable experience. And I think that same logic applies if you are simulating a universe for observers. You don’t simulate the world directly; you simulate the experience.

However, spherical simulations are also possible. The point is that a flat design is not ruled out, even if skeptics dismiss it.

But if we're inside a simulation, then maybe the one running it would *leave clues*. It would be like Fortnite secretly trying to tell all the kids what's really going on, while the adults are completely oblivious—except for that one “crazy drunk uncle” in the corner who keeps pointing at the screen.

Just a raw thought I had that may collapse upon further scrutiny, but: 3D space tends to form spherical shapes, yet our galaxy is flat. I think this may be because our galaxy is being squashed between two giant tori. If Earth is at the center of the universe (which is possible if interface theory is true), and if our Earth is even more special, then it could also be squashed between two giant tori, which would make it **flat**.

Fortnite

In **Fortnite**, all realities come from a cosmic source called the *Zero Point*, an infinite energy center connected to every universe. At its center lies Reality Zero and the Island, where people are trapped inside the Loop: a repeating cycle where time resets, memories fade, and battles happen endlessly.

The Loop and the Zero Point are controlled by the Imagined Order (IO), a secret organization seeking control over the multiverse. Opposing them is the Seven, a group trying to break the Loop and free reality from IO control.

Because the Zero Point connects all universes, characters from countless worlds can appear in Fortnite through dimensional rifts. Meanwhile, a destructive force called the Last Reality threatens to corrupt and consume existence itself.

I played many games as a kid, and my favorites were The Legend of Zelda: A Link to the Past, The Legend of Zelda: Ocarina of Time, various Super Mario games, and Final Fantasy VII, VIII, and IX, along with many others. But as I grew older, playing games became boring! I blamed my age. I thought I was simply too old for video games now.

Then, for some reason, I tried Fortnite, and I was instantly hooked! I still play it. It gave me adrenaline, and now I can find myself sitting in a bush with my heart racing.

I have also been fascinated by the occult and conspiracy theories since I was a teenager, and when I played Fortnite, my brain started making certain connections. The suppression of free energy could relate to the Zero Point, as in zero-point energy. The Loop is basically David Icke's grand conspiracy theory that humanity is trapped in a repeating cycle. The Imagined Order seems like a meme version of the New World Order, while the Seven reminded me of sacred geometry and the Freemasonic belief that an advanced human civilization once existed in the distant past. By advanced, I mean civilizations supposedly connected to UFO technology, and UFO lore plays a major role in Fortnite, which only added to my suspicion.

The Last Reality, however, I could not connect to anything specific.

What is the Last Reality? Could it be connected to David Icke's reptilians or the coming AI singularity?

All this is probably just my brain making associations, but if we do live in something like a simulation, as Plato's Cave, Gnostic cosmology, Hindu maya, and Buddhist samsara all seem to suggest in different ways, then maybe it is not so wild to imagine that reality is artificial in some sense. And if that were true, perhaps certain groups, such as the Freemasons, **know this to be true**, and symbolically express these ideas through pop culture, in various movies and games like Fortnite.

I realize this may sound speculative, but I do think it is a genuine philosophical possibility, and sometimes I wonder whether it is more probable than people are willing to admit.

Films and Games Featuring Symbolic, Esoteric, and Mythological Themes

Movies:

Prometheus (2012) for me tells of the distant past, when humans were technologically advanced and giants lived on Mars.

Stargate (1994) tells of the tech we once had.

The Matrix (1999) is a movie exploring deeper aspects of our reality.

Exodus: Gods and Kings (2014) tells of knowledge from this super-civilization through sacred geometry.

Indiana Jones and the Last Crusade (1989) also features this sacred geometry, which was the basis for the advanced technology they had.

Avengers: Endgame (2019) also presents sacred geometry through the Infinity Stones.

Avatar (2009) tells of a distant past when Earth was smaller and people were taller due to lower gravity. It reminds me of Lemuria.

And *Star Wars* is the biggest of them all, telling us about our distant past with magic (the Force) and free-energy weapons that could destroy entire planets. Looking at our solar system, it certainly looks as if planets have been destroyed.

Look, this is not rocket science. If our past had a super-civilization and they are the reason behind the UFO phenomenon, then Freemasons today, or even more secret organizations, likely know about this and would probably communicate it through movies, because they cannot openly say it. This seems entirely reasonable to me. So when you look at our distant past, such as the Baalbek stones, the Great Pyramid, etc., it is reasonable to suggest that this advanced civilization existed and may still exist today in some form, as reflected in the UFOs in our skies.

Games:

The Legend of Zelda tells of Atlantis, if you have the eyes to see.

The *Final Fantasy* universe tells of Atlantis, if you have the eyes to see.

The real list is probably much longer. These are just my observations.

Space Is Fake

The “space is fake” conspiracy theory is a deep one. It doesn’t just go against accepted science; it also questions the very foundation of what we think reality is, suggesting that the vast space above us—the entire cosmos—might just be an elaborate fake.

The theory claims that space exploration is part of a large-scale deception, carefully put together to mislead the masses—a constructed illusion designed to control global populations.

In this view, the sky above us is not an open doorway to an endless universe, but a solid dome or “firmament,” a concept found in some ancient writings, beyond which no human has ever actually gone.

From this perspective, all images, videos, and data said to originate from space are rejected as either computer-generated imagery or carefully produced footage filmed within terrestrial studios.

But is it true?

Hoffman’s work (especially his interface theory of perception) argues that our senses are not designed to show reality “as it is,” but

rather to present a simplified interface that helps us survive and reproduce. In that sense, what we perceive—space, time, and objects—is more like a user interface than a literal rendering of reality.

And here is my point: a dome model is logically possible under Hoffman-style anti-realist premises; however, it is not uniquely supported by them. That said, the dome model is not as crazy as it first seems. If we live in a simulation, a dome model could be one way to implement it.

For example, imagine an advanced alien species that travels to other planets and dominates other civilizations. Instead of killing everyone, they place them into simulations. These simulations might include a dome-like ceiling—a projected hologram sky—rather than simulating an entire cosmos in detail, as a more efficient way to imprison or contain conscious beings.

What is the evidence against the idea that “space is fake”?

1. Independent tracking of satellites.
2. GPS and global timing systems.
3. Rocket launches observed by multiple parties.
4. International participation (not a single authority).

Space activity is not controlled by one entity:

- NASA (USA)
- ESA (Europe)
- Roscosmos (Russia)
- ISRO (India)
- JAXA (Japan)

These organizations are politically independent and often competitors, yet their data about space remains consistent.

5. Astronomy is observable without space agencies.
6. Radio and optical astronomy.
7. Physical signals from space.
8. Direct imaging and multi-source confirmation.
9. Engineering dependence.

Modern infrastructure depends on space systems:

- Weather forecasting
- Ocean navigation
- Military communications
- Global internet timing systems

If satellites were not real, these systems would fail in ways that would be immediately noticeable worldwide.

10. Predictive power of physics.

My take:

The predictive power of physics? In a holographic universe, the math could work, but that doesn't mean space is big.

You then say: "The 'predictive power of physics' argument is not mainly about whether space is 'big' in an intuitive sense. It's about

whether there is a stable, consistent structure that behaves as if there is a vast, continuous spacetime with specific geometry and causal relationships.”

My response: But the dome could do this too. It could function that way if the cosmos is a simulation. A dome model could be engineered to behave indistinguishably from a vast spacetime.

You respond: ““Could reality be implemented in a way that produces this experience?” → yes, in many ways (including simulation-style ideas). “Which structure is actually the best explanation of observed consistency?” → spacetime models win because they are simpler, more direct, and have fewer hidden assumptions.”

Then my final response would be: I don’t care. I want what is actually true.

However, I still haven’t addressed the other “evidence against,” and I won’t do so in this book because I don’t believe space is fake. I don’t believe we live inside a computer simulation. I’m an idealist; I believe everything is fake! It is all Maya.

In philosophy, an idealist is someone who believes that reality is fundamentally mental or spiritual rather than material (physical).

What I actually believe in: I believe that humans were extremely advanced technologically in the past, and that this civilization contacted interdimensional aliens through the DMT experience. I also believe there has been a war ever since against these entities, which are shapeshifting reptilians, as some occult histories of the world suggest. They are shapeshifting because they cannot remain in our dimension, only phasing into it through blood rituals, etc. I fear they may have already won the war and placed the whole Earth in some form of quarantine or prison for the mind. In that sense, the dome model would no longer surprise me.

NASA

Why does NASA have a snake tongue in their logo?

My take:

The snake tongue means they are liars, speaking with “two tongues” like a snake—because it is the snake, the devil, **Satan**. NASA is an anagram for Satan. You will find the missing T in the center of the logo itself, but hidden. You have the snake biting its own tail, going against the direction of time, anticlockwise. This is the axis mundi, and to complete the axis mundi you need to insert the cross that Jesus died on—the Tau symbol, the T.

Yep, space is a lie. The Earth is at the center of all creation. This is even confirmed by physics in their “axis of evil” (cosmology). They have the proof, but mainstream science just brushes it off as “something must be wrong with the data.” No, the data doesn’t lie. It is their interpretation of the facts that is a lie.

If you ask an “expert,” he will likely say: “The ‘axis of evil’ in cosmology refers to an anomaly in the cosmic microwave background (CMB), where temperature fluctuations seem to align with the plane of our solar system, which goes against the principle that the uni-

verse should be isotropic (the same in all directions). This alignment was initially considered baffling because it suggested our solar system might have a privileged position in the universe, but many scientists now believe it is likely a statistical fluke or a data-processing artifact.”

I mean, a privileged position? The Earth is in the center of all creation! Just tell it like it is! Jesus. And this is a fluke? No, it is not a fluke. It is just that modern science is a joke.

Watch:

The Principle (2014 - Full Movie)

Bigfoot

Bigfoot (also called *Sasquatch*) is a legendary creature said to inhabit forests, mainly in North America. It's usually described as a large, hairy, human-like ape, standing around 2–3 meters tall, leaving oversized footprints—hence the name “Bigfoot.”

Stories about Bigfoot come from a mix of:

- Indigenous North American folklore (various “wild man” or forest giant traditions)
- Modern eyewitness reports (often in remote forest regions)
- Hoaxes and misidentified animals
- Pop culture (films, documentaries, internet stories)

Is Bigfoot real?

There is **no scientifically verified evidence** that Bigfoot exists.

Despite decades of searching:

- No confirmed body or remains have ever been found
- No verified DNA evidence has held up under scientific review
- Most footprints, photos, and videos are either hoaxes or ambiguous natural phenomena
- Extensive wildlife surveys in claimed habitats have found no unknown large primate species

Given what we know about ecology and biology, a breeding population of a large unknown ape in North America would almost certainly have left clear, repeatable evidence by now.

My take:

Graham Hancock and Randall Carlson are prominent researchers and authors known for their theories challenging mainstream archaeology and geology. They frequently collaborate to popularize the Younger Dryas Impact Hypothesis, which suggests that an advanced, lost ancient civilization was wiped out by a cataclysmic comet strike approximately 12,800 years ago.

If they are right, we can see Bigfoot in a new light.

If there was a lost civilization, then the Freemasons know about it.

If the Freemasons know about it, then they will tell us through movies.

If they are telling us through movies, the enigmatic riddle of Bigfoot becomes easier to explain.

Bigfoot is a member of a species of primates that evolved alongside our ancestors, in a way similar to Neanderthals or other closely related hominin species. I believe he “magically” vanishes because he is now working with our ancestors as part of the crew of their UFO craft. We see this reflected in *Star Wars*, where Chewbacca is essentially Bigfoot in plain sight, and the *Millennium Falcon* represents the UFO.

This lost civilization still exists and continues to operate in our skies.

But why would a supercivilization that controls UFOs need samples from the forests of North America?

If they live inside the Earth, they might sample things above ground and take them underground for various purposes, such as study, preservation, resource use, or experimentation.

But if the “UFO inhabitants” are human, then deploying a Bigfoot-like hominin to carry out surface operations would appear, at first glance, to be illogical.

My response: I agree. However, if you understand human psychology, the logic changes. There is effectively no scenario in which the scientific community would accept the existence of Bigfoot!

“So what are you saying?”

I'm saying that if I were Han Solo, I'd send Chewbacca off to do all the boring tasks too!

Aliens

The film *Aliens* (1986), directed by James Cameron and a sequel to Ridley Scott's *Alien* (1979), is widely regarded as one of the greatest sequels ever made. I still remember watching it, and in many ways it marked one of my earliest introductions to the idea of “aliens” as something more than fiction. Back then, films like this felt different—more grounded, more intense, and often more impactful than much of what is made today. It wasn't just entertainment; it sparked a lasting curiosity about what might be out there.

So without further ado, the next conspiracy theory on my list: *aliens*

“Aliens” is one of the biggest umbrella conspiracy topics because it blends government secrecy, ancient mythology, psychology, astronomy, military sightings, and existential fear into one giant mystery. Most alien theories fall into a few major categories:

Government Cover-Up

This is the classic modern alien conspiracy.

The idea is that governments — especially the United States Air Force, NASA, or intelligence agencies — secretly know extraterrestrials exist but hide the truth to avoid panic or loss of control.

The most famous claims include:

- Crashed UFO retrievals
- Reverse-engineered alien technology
- Secret underground bases
- Deals between governments and non-human beings
- Suppression of whistleblowers

The most famous case is the alleged crash at Roswell Incident.

Ancient Aliens

This theory argues that extraterrestrials influenced ancient civilizations.

Supporters point to:

- The pyramids
- Megalithic architecture
- Mythological “sky gods”
- Advanced astronomical knowledge

- Ancient artwork interpreted as spacecraft

Popularized heavily by the TV show Ancient Aliens and writers like Erich von Däniken.

Critics argue this often underestimates ancient human engineering and can drift into pseudohistory.

UFO / UAP Phenomena

This category became more mainstream after military footage releases in the 2010s and 2020s.

Governments now often use the term “UAP” (Unidentified Anomalous Phenomena) instead of UFO.

Cases like:

- The Phoenix Lights
- The Belgian UFO wave
- US Navy “Tic Tac” encounters

...are widely discussed because trained military personnel reported objects behaving in unusual ways.

Importantly:

“Unidentified” does not automatically mean extraterrestrial.

Possible explanations can include:

- Misidentifications
- Atmospheric effects
- Experimental military technology
- Sensor glitches
- Psychological contagion
- Or genuinely unexplained phenomena

Alien Abduction Narratives

People like Whitley Strieber and the famous Betty and Barney Hill case popularized claims of alien encounters.

Common patterns include:

- Missing time
- Bright lights
- Medical examinations
- Telepathic communication
- Sleep paralysis-like experiences

Psychologists often connect these experiences to:

- False memories
- Hypnagogic states
- Sleep paralysis
- Cultural influence

But believers argue the consistency across reports suggests something external.

Simulation / Interdimensional Theories

Modern alien theories increasingly move away from “space visitors.”

Instead, some speculate:

- Interdimensional beings
- Reality manipulation
- Simulation glitches
- Consciousness-based entities

This overlaps with paranormal theories, spirituality, and speculative physics.

Why Alien Theories Became So Powerful

Alien conspiracies exploded after:

- World War II
- The Cold War
- Nuclear weapons
- Rapid technological growth
- Secrecy surrounding military projects

Many real government secrets existed — stealth aircraft, classified weapons, psychological operations — which created fertile ground for broader speculation.

For example, experimental aircraft like the Lockheed U-2 and Lockheed SR-71 Blackbird were once mistaken for UFOs.

The Core Divide

The alien topic really splits into three broad positions:

1. **Skeptical:**

Most sightings are explainable and no strong public evidence proves extraterrestrials have visited Earth.

2. Open but cautious:

Some cases remain genuinely unexplained and deserve scientific investigation.

3. Full disclosure believers:

Governments already possess alien knowledge and actively conceal it.

That middle category has grown significantly in recent years because even mainstream institutions now admit some aerial phenomena remain unresolved.

My take:

I used to believe in aliens for a long, long time...

As for extraterrestrial life itself, statistically it would be surprising if intelligent life exists nowhere else in the universe. The scale of the cosmos is enormous. The real question is whether such life has visited Earth.

But then I thought: Is that really the right question?

Fermi's Paradox has never truly been resolved — only brushed aside. "They" should be here, so why aren't they?

Then I came across the solution: Donald Hoffman's Interface Theory of Perception (ITP). Hoffman proposes that our senses do not reveal objective reality. Instead of showing us the "truth," evolution has shaped our perceptions into a species-specific user interface. Much like the desktop on a computer, it hides the deeper underlying reality in order to guide adaptive behavior and ensure survival.

So then the real question becomes: Why should there be aliens inside our interface at all?

We are like goldfish inside a fish tank, so why should there be sharks inside that same tank?

Thus, nowadays I no longer believe in extraterrestrial aliens in the traditional sense — except perhaps interdimensional ones, which we will return to later.

That is, there could be entities outside the fish tank peering in: the so-called shapeshifting Reptilians. I do believe that is the case, but the key point is that they are not inside our universe. Rather, they manipulate events from the outside. They can only occasionally shapeshift into our reality through blood rituals, which would explain why this world appears ruled by dark, satanic forces.

But what about UFOs?

I believe those are human-made — though not by ordinary humans. These are the supermen, the gods of our ancestors, members of a lost civilization whose lifespans are vastly longer than our own. Normal humans may live to around one hundred years, but these beings live for a thousand years or more. They are the lost civilization that Graham Hancock has spent decades searching for.

In other words, humanity is far older than modern science claims, and in the distant past we evolved to a level of technological sophistication that far exceeds even our modern age.

How do you think we evolved so fast this time around? Answer: → we had help.

The Solution

- We don't perceive reality directly (Hoffman).
- So the assumption that "they should be visible in our reality" is invalid.
- Therefore, the absence of aliens is not surprising, because they are not in our "interface layer."

Fermi asks: “Where is everyone in observable universe space?”

My answer: “Observable universe space may not be the correct domain of contact at all.”

Even if ...

Even if gray aliens stepped out of a UFO, I would still assume they are either engineered beings or future humans. That wouldn't necessarily mean they are extraterrestrials.

And if idealism is true and a spirit world exists, then some UFOs could be our ancestors returning and manifesting within our reality. In that case, the UFO phenomenon might be a mixture of real physical craft and what could be called non-physical craft.

In other words, the UFO/UAP phenomenon is very likely **complex**.

The Greys

The “Greys” (small bodies, big heads, huge eyes, skinny arms and legs) come from UFO folklore, but honestly, I always wonder: how would something like that even evolve naturally?

I just don’t really see it.

So if beings like that are real, my guess is they would have to be artificially created somehow — genetic engineering, cloning, artificial wombs, external development, etc. — rather than being a normal naturally evolved species.

The Alien in “Alien”

I’ve always thought of real aliens as truly “alien” in the deepest sense—beings from a completely different biological lineage, perhaps not even based on DNA. In that sense, one might imagine our biology would “react” instinctively to their presence, as if our genes themselves would scream at encountering something so fundamentally **other**.

However, if a being did not share DNA or even a similar biochemistry, our bodies would not automatically recognize it as “alien” in any direct or reliable sense. Human instinct is primarily tuned to:

- threats (size, motion, aggression)
- social cues (faces, gaze, posture)
- learned fear associations

The idea that “our genes would scream” is therefore more metaphorical than biological. Evolution does not build detectors for the unknown in itself—it builds responses to recurring patterns within Earth’s environments.

Still, that intuitive sense of radical *otherness* is what I personally mean when I think of a “true alien.”

Green Blobs

I don’t really see aliens as green blobs or completely random life-forms. If intelligent beings became advanced enough to build civilizations, spacecraft, and etc., then I think they would probably have to be at least somewhat humanoid in structure.

To me, that could only really be explained in two ways: either through convergent evolution — where similar environmental pres-

tures lead to similar body plans — or because they originally came from humanoid beings themselves, such as later-evolved artificial beings or robots capable of taking different shapes and forms.

However, I have recently begun to question whether a technological singularity is even possible, as I do not see how the universe could withstand such an event. From this perspective, advanced “robots” would have to be more akin to humanoid helpers rather than products of an autonomous machine civilization.

Type 3

Because of convergent evolution, I think the first aliens we would encounter would be humanoid—either ape-like beings similar to us, or lizard or dinosaur-like beings. I don’t see any third option, which is why the Reptilian conspiracy feels much more **real** to me than any other alien conspiracy.

My Bet

If I had money, I would bet like this: Grey aliens = beings engineered by the Nordics (Pleiadians). Nordics = not from the Pleiadians, but from Inner Earth—the civilization Hitler allegedly tried to find and that Admiral Byrd reportedly encountered. Reptilians = interdimensional beings the Nordics contacted via DMT experiences, and there has been a war ever since. Mantids = I think these are from the DMT experience; whether they are real or not, I don't know.

Elongated Skulls

Many cultures across the world practiced artificial cranial deformation.

It often started in infancy, when skull bones are still flexible.

It was socially significant (status, identity, group belonging).

It is found in:

- The Andes (Paracas, Nazca, etc.)
- North America (Chinook, Salish, etc.)
- Parts of Africa, Europe, and Asia
- Pacific Islands (including cases in Melanesia and Polynesia)

Yes, this practice is widespread.

Yes, it often appears coastal or trade-linked.

But no, they are not space aliens.

My take:

Humanity is much older, and a highly advanced human civilization still lives inside the Earth. They are behind the UFO phenomenon, and some of them came to the surface and were perceived as gods. These beings, these Elohim, were seen by ancient people, who interpreted them as divine rather than human or technological. So they were treated, described, or remembered as gods in myth and religion. Then our ancestors tried to replicate their likeness, thus we get the elongated skulls. So, some of these elongated skulls are actually the skulls of “gods,” and others are of primitives trying to emulate the gods.

Also, I recommend watching DeDunking (Dan Richards) discuss elongated skulls on YouTube.

Akhenaten

Many Egyptologists believe the Amarna period used a highly stylized artistic canon. Akhenaten and his family were deliberately depicted with exaggerated features (elongated head, narrow face, long limbs) as part of a symbolic religious style linked to his reforms.

Or: as always, the mainstream has no clue, and the unusual representation may be because Akhenaten was actually one of the “gods” we just talked about, or a descendant of them, and wanted humanity to live according to a better philosophy—the philosophy of the gods of this inner Earth civilization. Basically, advanced humans living among primitives in order to help them evolve.

Core of his philosophy: Atenism

Akhenaten promoted the worship of a single deity, the Aten, represented as the sun disk. This system is often described as an early form of monotheism or monolatry (belief in one primary god while others are de-emphasized).

The Nemes Mystery:

The nemes headdress—best known from Tutankhamun's mask—is one of the most iconic symbols of ancient Egypt.

But here's the weird part:

We've never actually found a confirmed physical nemes.

Not one.

So why does something so important just... disappear?

Mainstream archaeology says it was made of linen and simply decayed over time. Fair enough.

But is it fair? Fragments (or even a full example) could potentially survive for thousands of years, like other Egyptian linen finds.

So, that still leaves a question:

What are we really looking at?

The nemes doesn't really look like something that slowly evolved. It looks standardized—like it was already established from the beginning of Egyptian kingship.

That raises a simple but uncomfortable question:

What if Egypt didn't invent it—but inherited it?

The Atlantean Idea

One alternative view is that symbols like the nemes could come from a much older lost civilization—Atlantis.

Also, get this: Tutankhamun was the son of Akhenaten!

Fairies

Fairies are one of those ideas that look simple on the surface—tiny winged beings—but actually come from a deep, layered history of folklore, religion, and storytelling across Europe. What we think of as “fairies” today is really a blend of several older traditions that evolved over time.

But I won’t go into the history of fairies or their evolution in this book. I will just briefly state what I think they could be.

The way I interpret it, fairies are beings from the Inner Earth. These could be humanoids that evolved alongside our ancestors, which would correspond to the *nisse* in Norwegian folklore. If the Hollow Earth hypothesis is true and humanity evolved inside it, then one could imagine many other creatures evolving there as well.

Alternatively, they could be intelligences in the spirit world—beings encountered in altered states of consciousness, such as during experiences with psilocybin mushrooms or DMT, where entities are sometimes reported.

Another possibility is that there is a hidden meaning in the word “fair” itself, referring to “the beautiful people,” and connected to the idea of the Agarthans—a legendary, highly advanced underground civilization residing within a mythical subterranean world known as Agartha.

In the oldest European folklore, fairies were generally **not originally imagined as tiny winged beings**. That modern image mostly comes from Victorian-era art and literature in the 1800s.

Earlier traditions—especially Celtic mythology—described fairy-like beings as:

- powerful nature spirits
- supernatural humanoids
- hidden peoples
- or remnants of older pagan deities

For example, the **Tuatha Dé Danann** in Irish mythology are often considered one of the strongest historical sources behind later fairy traditions. They were portrayed more like divine or semi-divine beings than miniature creatures.

Tuatha Dé Danann

The Tuatha Dé Danann are a supernatural people from Irish mythology, often described as divine or semi-divine beings associated with magic, wisdom, craftsmanship, and sovereignty. They occupy a central place in Ireland's medieval mythological tradition and are portrayed as powerful rulers who arrived in Ireland before the ancestors of modern humans. Their stories form a major part of the Irish Mythological Cycle.

Sounds like Atlanteans to me...

Douglas Adams: *"Isn't it enough to see that a garden is beautiful without having to believe that there are fairies at the bottom of it too?"*

My response: No. Because when I see a beautiful garden, my first thought isn't that it must have happened because nobody was tending it.

Some people have experienced time itself coming to a halt—only for fairies to emerge from the woodwork and get the whole damn thing running again.

Explain that, Douglas!

Maybe the fairies aren't decorating the garden.

Maybe they're maintaining the machinery of reality itself.

Humans Never Actually Went to the Moon

Apollo 11 in 1969 was staged by NASA and the U.S. government. Humans never actually went to the Moon.

It's one of the most studied conspiracy theories ever, and it falls apart under many independent lines of evidence. Or so they say.

Look, I believe we went to the Moon because I believe in an advanced inner Earth civilization, and that our government is working with them. So of course we could go to the Moon; the “supermen” provided the technology. But at the same time, I believe parts of it were faked and filmed on Earth as a psyop.

But here, I like to play the devil's advocate anyway.

1. Independent verification (not just NASA)

The Moon landings were tracked by multiple countries and observatories at the time, including the Soviet Union, America's biggest rival in the space race. If there had been any hint of fakery, the USSR had both the motive and the technical ability to expose it immediately.

Instead, Soviet tracking confirmed the missions.

My take:

- The USSR was also part of the same deception or was politically incentivized not to expose it during détente.
- Cold War "competition" does not guarantee honesty; intelligence agencies can and do cooperate in secret.
- Tracking Apollo signals only proves that something was broadcast, not that humans went to the Moon.

If an advanced inner Earth civilization exists, it's possible the top levels of the US and USSR knew about it, and the public Cold War rivalry didn't reflect what was really happening behind the scenes.

2. Physical evidence still exists

The Apollo missions left behind:

- Retroreflectors on the Moon (still used today to bounce lasers off the lunar surface to measure distance)
- Rock samples brought back (analyzed worldwide, including outside NASA)
- Hardware and landing sites visible from modern lunar orbiters

For example, NASA's Lunar Reconnaissance Orbiter has photographed the Apollo landing sites, including astronaut tracks and equipment.

My take:

- Retroreflectors on the Moon could have been brought there by occupants of UFOs, since I believe these are advanced humans from an inner Earth civilization. Alternatively, reflectors could have been deployed remotely without astronauts.
- Rock samples could likewise have been provided by these advanced beings.
- Hardware and landing sites visible from modern lunar orbiters could also be faked (e.g., by these advanced beings), which is a very high bar—but perhaps not if you consider the level of intelligence involved in this.

3. The “anomalies” people cite have explanations

Common claims include:

- “Waving flag in a vacuum” → the flag was moved during planting and held in shape by a horizontal support rod
- “No stars in photos” → camera exposure settings were adjusted for bright sunlight on the lunar surface
- “Shadows look wrong” → uneven terrain and wide-angle lens distortion create perspective effects

None of these require anything exotic once you understand lighting and optics.

My take:

You are assuming the conclusion (that the Moon landing happened) and then explaining away contradictions.

Then you say you are not explaining away after the fact, but are *really* explaining the anomalies. I say that explaining and explaining away are the same thing—both are interpretations of data. That is to say, on a purely philosophical level, you can argue they collapse into the same thing: both “explaining” and “explaining away” are acts of inter-

pretation applied to experience or data. At the epistemological level, both are interpretation, not access to “pure,” uninterpreted truth.

4. The scale of required secrecy is unrealistic

To fake it would have required:

- Thousands of engineers, astronauts, and contractors
- Independent tracking stations worldwide
- Complete silence from whistleblowers for decades
- Consistent fabrication of physical samples and telemetry

The coordination problem alone makes it far less plausible than the actual Moon missions.

My take:

Compartmentalization: most participants did not know the full truth.

Compartmentalization is real and important—but by itself it is a partial explanation of information distribution, not a complete explanation of global consistency across independent systems.

So philosophically: it explains how ignorance can exist inside a system, but not automatically how a fully coherent large-scale decep-

tion could be sustained across all external points of contact. But the larger point is that it *could* work, and that is the real point. However, possibility alone doesn't settle which explanation is most grounded in the structure of the evidence we actually observe. So the deeper question is: what do we actually observe?

I observe the Great Pyramid, the Baalbek stones, etc., which tells me that a lost civilization is true, which then rationally explains the UFO phenomenon, and we get this secret group of supermen working with our governments. Or you need to believe MrBeast when he told Zahi Hawass there is nothing to see inside the Sphinx, as they stand atop a layer of sand that can be removed but never is.

"There is nothing inside the Sphinx." — MrBeast. Now becoming the greatest liar in history!

5. Why the idea persists

It's less about evidence and more about psychology:

- Governments have lied in history, so people generalize
- Space is unfamiliar, so visual "oddities" feel suspicious
- Social media rewards confident alternative explanations over technical nuance

My take:

- The real bias is trust in authority (NASA, government, media).
- People reject the hoax theory due to conditioning and institutional trust.
- Mockery and social pressure discourage open investigation.

The key underlying pattern

True, my position here does not operate like a normal scientific hypothesis that gets updated with counterevidence. That makes the position non-falsifiable in practice, but it cuts both ways depending on how strictly someone applies it.

The mainstream position has its own version of the same pattern, just reversed:

- Evidence contradicting Apollo → “absorb it”

In short, my argument here identifies a closure under reinterpretation problem, where everything gets absorbed into the theory. I would reply that mainstream science also has reinterpretation layers for anomalies, so the accusation is symmetrical.

And that is my point. Mainstream thinking often uses similar interpretive flexibility, just in the opposite direction!

So, at the end of the day, I don't know what to believe. We humans are so easily fooled!

And everything can always be explained away and reinterpreted to fit a mainstream view.

Bottom line: 007 showed us the landings are fake. And Apollo means the sun. So those who are attuned to the occult know this was all staged.

Beneath the bottom line: Original Apollo 11 telemetry recordings (the SSTV tapes that contained the highest-quality raw signal from the Moon) = lost. I mean, you cannot make this stuff up!

"There is nothing to see here," as Zahi Hawass might say.

In sum: The Moon landing hoax was brought to you at the same time as MK-Ultra by the same organization. And even the skeptic will admit: if your point is simply that NASA's Apollo program and CIA programs like MK-Ultra both operated inside the same Cold War system of U.S. government power, secrecy, and funding—then yes, that framing is fair!

I think many don't believe in the Moon landings because if the truth ever came out and we *never* went to the Moon, people would be like: "That's right, you couldn't fool me!" So it's an ego thing. But it's more

than that—you don't want to be butt-fucked by the devil. And that is the real reason people disbelieve the Moon landings.

...like an emotional or moral reflex against feeling deceived or “tainted” by a powerful, manipulative system ... metaphorically defiled by the metaphorical devil...

Basically, people don't like being defiled—whether physically, emotionally, or spiritually.

Or maybe the conspiracy theorist would say, **“No, this is about one thing and one thing only: the truth. I just want to know what's really going on.”**

Conspiracy Logic

*C*onspiracy logic is a way of interpreting events where hidden coordination is assumed to be the default explanation, especially when information is incomplete, ambiguous, or contradictory.

A clear definition would be:

Conspiracy logic is a pattern of reasoning in which complex or uncertain events are explained primarily through intentional hidden coordination, and where conflicting evidence is often reinterpreted as part of that same hidden coordination.

1. Starting assumption

- Mainstream reasoning:

Starts with multiple possible explanations (error, coincidence, institutions, physics, deception, etc.) and tries to narrow them using evidence.

- Conspiracy logic (in the strict sense):

Starts with intentional hidden coordination as the default lens, and other explanations are often secondary or dismissed.

2. How counterevidence is treated

- Mainstream reasoning:

Counterevidence usually leads to:

- o updating the model
- o refining assumptions
- o or discarding a hypothesis

- Conspiracy logic:

Counterevidence is often reinterpreted as:

- o part of the deception
- o misleading signal
- o or intentional cover-up

This is where the “self-sealing” problem can appear.

3. Role of institutions

- Mainstream reasoning:

Institutions (NASA, universities, observatories, etc.) are treated as imperfect but generally reliable unless proven otherwise in a specific case.

- Conspiracy logic:

Institutions are treated as potentially coordinated actors within a single hidden system, so their agreement is not strong evidence.

4. What counts as a good explanation

- Mainstream reasoning:

Prefers explanations that are:

- o constrained by physical laws
- o consistent across independent measurements
- o predictive (can be checked in advance)

- Conspiracy logic:

Prefers explanations that:

- o unify many anomalies under one intentional cause
- o even if that cause is not independently testable

5. The deepest philosophical difference

At root, it's this:

- Mainstream approach:

"Reality is messy; causes are often distributed, accidental, and multi-layered."

- Conspiracy logic:

"Behind apparent messiness, there is often a hidden intentional order."

Neither is "pure truth" or "pure delusion" as a general principle—they are different cognitive priors about how structured reality is.

Bottom line

The difference is not that one "believes in conspiracies" and the other doesn't.

It's that:

mainstream reasoning treats conspiracy as one hypothesis among many, while conspiracy logic tends to treat conspiracy as the organizing principle of interpretation.

My Take:

A conspiracy theorist reading this would be angry—and rightfully so—and might say the opposite is true: that it is mainstream reasoning that uses so-called conspiracy logic here. I mean, “mainstream reasoning = updating the model”? *Biggest joke they’ve ever heard.* And I agree. The bias in our world today is so huge that, if modern science is ever to progress for real, then something fundamentally needs to change. And that change might come from the actual truth finally leaking out. Before that happens, I don’t see how this world will ever progress.

The Rabbit Duck

The rabbit–duck illusion is often used in the philosophy of science to illustrate a fundamental feature of human perception and scientific observation: what we see is not purely determined by raw sensory data, but is shaped by interpretation.

In the image, the same set of lines can be seen in two distinct ways—either as a rabbit or a duck. Nothing in the visual input changes, yet the perceived object can shift. This simple example is used to demonstrate what philosophers call the theory-ladenness of observation, the idea that observation is influenced by the conceptual frameworks we bring to it.

Philosophers such as Norwood Russell Hanson argued that scientists do not encounter neutral, theory-free facts. Instead, they interpret what they observe through prior assumptions, concepts, and expectations. In this sense, “seeing” in science is not just a passive recording of data, but an active process of interpretation.

The example also connects to the idea of underdetermination, associated with W. V. O. Quine, which suggests that the same set of evidence can, in principle, be compatible with more than one theoretical explanation. Just as the rabbit–duck image allows multiple readings, scientific data can sometimes be structured in different ways depending on the theoretical lens applied.

Thomas Kuhn’s notion of scientific paradigms adds another layer to this discussion. According to Kuhn, scientists working within a given paradigm tend to interpret data in a stable, shared way. However, during a paradigm shift, the same body of observations may be re-organized and “seen” differently under a new conceptual framework, much like switching between the rabbit and the duck.

However, philosophers also emphasize the limits of this analogy. Unlike the rabbit–duck image, where both interpretations feel equally available, scientific theories are constrained by prediction, coherence, and empirical testing. Over time, interpretations that fail to match evidence or produce reliable predictions are discarded. This means that while interpretation is flexible, it is not unconstrained.

But the deeper problem is that philosophers sometimes overemphasize their own emphases, which leads to the illusion that science is steadily marching forward. That is, the way science “discards” ideas is not always purely objective or final. What counts as a failed theory is often judged within an existing framework that already decides what kinds of explanations are acceptable. This means some ideas may be rejected despite the fact that evidence exists to support them—as in the case of the growing Earth—but are discarded anyway because they don’t fit the way current science is set up to think about the problem.

In truth, the growing Earth model could be shown to be correct in the future, despite the impression that “interpretations which fail to match evidence or produce reliable predictions are simply discarded as science progresses,” which is taken to mean that Pangaea is true and the growing Earth is false because “a theory is rejected if it consistently fails across multiple independent tests and measurements,” which is why the growing Earth is discarded because it failed this “objective” process.

In reality, discarded ideas are often rejected because of bias, not because science is purely objective and objectively marching forward. And the future will show that the growing Earth model is correct, and then it will become clear where the philosophers themselves erred. They said the rabbit–duck wasn’t that **strong**, but they were wrong!

Then you say: “Your claim that the growing Earth model is currently rejected mainly due to bias rather than failure across multiple independent measurements is not supported in mainstream geology or geophysics.”

My reply: That is not what I said! I said that the **judgment of failure** across multiple independent measurements is itself biased!

In summary, the rabbit–duck illusion highlights a central insight in the philosophy of science: observation is not purely objective in a naive sense, but is shaped by interpretation.

The World Is a Stage

All the world's a stage. That's from Shakespeare. And we just saw the rabbit-duck illusion. Mainstream science says the universe is real, but from another perspective, what if it is a stage?

If idealism is true, the world could be a stage, like your dream is a stage. We could be the Buddha dreaming the universe into being, and the universe would literally be a stage just like in dreams. If you dream of flying, then the setting is a stage, literally so. Another way the world is a stage is if we live in a computer simulation. I don't personally buy it, but it could be true. However, I believe the world is a stage because I'm an idealist who takes seriously the notion that the universe is some kind of dream.

So if we cannot solve the hard problem of consciousness, it suggests that the world may be understood as a kind of stage: a structured field of experience in which everything appears and unfolds. In that sense, Shakespeare was right!

Truman

The Truman Show is a 1998 satirical drama film directed by Peter Weir and written by Andrew Niccol. It stars Jim Carrey as Truman Burbank, a man who unknowingly lives his entire life inside a massive television set, broadcast to the world as a reality show.

In the film, Truman lives inside a perfectly constructed world that appears real to him but is actually an artificial set controlled by a hidden director and broadcast to an audience. Everyone around him is an actor, and even the weather and major events are staged.

The Truman Show is essentially a cinematic version of the “world as a stage” idea. After watching the film, you are left with the unsettling question: What if this is true in a deeper cosmic sense?

This brings us to solipsism.

Solipsism, the way I understand it, has three layers.

The first layer is epistemological: the only consciousness you can know with certainty is your own.

The second layer is metaphysical: a strict or “metaphysical” solipsist may believe that only **one** consciousness truly exists.

The third layer is emotional: “I am all alone.”

I believe in the oneness of consciousness, so in a certain sense I believe solipsism is true—if solipsism is defined as the oneness of consciousness. However, this universal mind or oneness is not a social creature. So if solipsism is defined through the emotional layer—“I am all alone”—then I would say solipsism is false, because the feeling of loneliness requires a social identity, which the universal mind itself does not possess.

The deeper question, then, is this: are the people around you conscious in their own right, with unique and separate consciousnesses, or do we all share the same underlying consciousness?

Since I believe in the oneness of consciousness, I would say that people are real, but that we all participate in the same underlying consciousness. Even biologically, if I am 50% my mother and 50% my father, then tracing backward through time suggests a deeper unity among all human beings as well.

So, do I believe in solipsism? That depends entirely on how one defines solipsism.

But what if your mother is a paid actor? What if you are **really** in The Truman Show? What if you are in a simulation, and such simulations would have more NPCs than real people, since it would be easier to populate them that way—just as it would be easier to create simulated universes than real universes? In that case, simulated universes would vastly outnumber real ones, and the same could be said for people.

I mean, think about it: if advanced civilizations can run many simulations, then simulated worlds (and possibly simulated beings or NPCs) could vastly outnumber “base reality” beings. And what are the odds, then, that we live at a time when the technological singularity is about to happen? If you ask Elon Musk, he would probably say something like: **yes**.

And if the inner Earth civilizations lost the war against the shape-shifting reptilians and they trapped us in a simulation... **then your mother could be a lizard!**

That my mother was an alien impostor was an actual thought I had as a kid, lol—before I even knew about inner Earth theories or simulations. And now that I can see how it could be “logically possible” in a real sense, I don’t actually believe it, of course.

But I still wonder: why did my childhood brain go there? Maybe it is simply that kids often test extreme “what if” scenarios—or did I remember something from a past life? Not that my mother is reptilian, but that reptilians themselves exist.

Descartes' Evil Demon is a thought experiment by René Descartes in which he imagines a powerful, intelligent being that deliberately deceives us about everything we experience.

The idea goes like this:

What if there is an extremely powerful “demon” (or intelligence) that controls all of your perceptions—making you believe in an external world, other people, even your own body—when none of it is real?

The purpose isn't to claim such a demon exists. It's to push skepticism to its extreme limit. And the deeper point is this: even if your mother is an alien, even if you are in a simulation, even if you are being controlled by outside forces, in the end, it is all you if the oneness of consciousness is true. So, the **demon** is you!

That conclusion follows only if you fully commit to a strong form of idealism or nondual oneness, which I do. The deceiver and the deceived are the same entity.

Even in radical skepticism, what cannot be removed is the fact that I am the demon.

So if I'm the demon, then I'm stuck in the Matrix. So what is the Matrix?

The Matrix is an appearance within consciousness. In the beginning there was universal consciousness, then it separated like a whirlpool in an ocean. Now the whirlpool thinks it is the only thing that is real. This caused fear. The fear led to the creation of the Matrix, which is a simulated world that the whirlpool could live in to escape the fear. Imagine you are in hell watching TV. The TV became an escape from reality. But then the TV itself started to feed off fear because it was fear that created it. The TV initially displayed paradise, but then paradise was replaced by shows displaying fear instead. And the greatest fear of all is the Truman Show, which means it is real. And here we are.

But if you didn't understand any of that, read *Tales from the Time Loop* by David Icke, especially Chapter 12.

Could it be true?

Let us examine the elements one by one.

Universal consciousness: This is the one I consider to be 100% true because it is impossible for reality to become other than what it is. You can rearrange the Lego bricks, so to speak, but I do not see how the Lego bricks themselves can become something else no matter how you rearrange them. In the same way, I do not see how matter can generate

consciousness, and the hard problem of consciousness will remain forever simply because it is impossible for Nature to become other than what it is, which is consciousness. Consciousness is Nature's given for a reason.

Universal fear: This one is more speculative, but it is not impossible to envision because, if you start with universal consciousness, then humanity must be a dissociation of that field, like Bernardo Kastrup philosophizes about. Then, if we add Donald Hoffman into the mix, we get the idea that our universe is a user interface, which raises the question: Where is this interface located? A good guess would be in the subconscious field of humanity or, even deeper, in the unconscious field. The subconscious holds accessible information, memories, and automatic habits you can easily recall. The unconscious is much deeper, housing primal instincts, hidden fears, and repressed traumas that you cannot actively access.

And if the Matrix is rooted in this field of hidden fears, then it is not impossible to envision this being actually true!

The Matrix: The Matrix here would be reality as experienced through the eyes of the dissociated alters.

Feeding off fear: This one is even more speculative, but imagine taking a conscious journey through the unconscious field where our deepest fears are manifested, like through a DMT trip or something. This would be a dark place, and your conscious aspect would want to leave it. So maybe the way it escapes is by generating the Matrix. But now the Matrix can become "alive" in its own right because the

only way to keep the conscious aspect away from hell, so to speak, is to create a time loop.

Why a loop? Because, let's face it, time is a loop.

Why a loop? Because time itself appears paradoxical if understood as purely linear. A beginning immediately raises the problem of infinite regress: what caused the beginning?

Why a loop? Because...

Time is an illusion, and even Einstein understood that because the moment you say time is real, you get these irresolvable paradoxes caused by linearity. Physicists today are trying to bootstrap the universe using Klein bottles and whatnot in order to resolve the paradoxes that come with taking time too literally. I say good luck, you will never succeed. So, time being a loop is not so crazy after all. Maybe that is the only way to create time: you loop it.

So, imagine consciousness being trapped in this loop. In the beginning, everything was like paradise, so why generate a world full of suffering? But the Matrix was not created by bliss, but by the darker aspects of the collective human psyche.

So, if the Matrix is rooted in the unconscious and uses it as a battery, as it were, then it is not impossible to imagine the fears of that place coming to the surface!

David Icke was told by Mother Ayahuasca that this is how reality is constructed, and I am trying to use philosophy to make sense of it all. But read Icke's version in case I have misrepresented it.

However, is all of this true? Short answer: I do not know. **But it could be.** Humanity is old and, if idealism is true, then something like this could also be true.

Shapeshifting reptilians: This one is speculative for most people, and I get that, but for me it is normal. If aliens exist, then convergent evolution would produce humanoids and there are only two types of humanoids Nature would make, in my opinion: ape-men like us and lizard-men. So, I do not think this is so far-fetched at all when you consider the age of the universe and the vastness of eternity. If our ancestors were highly advanced in the past, then for them to encounter lizard-men "out there" would almost be natural, or outright natural.

The ultimate agenda: The agenda of the Matrix is simply to continue the time loop at all costs (compare it to Fortnite's **Imagined Order**). But I envisioned my own "ultimate agenda," which I realize is just me making science fiction, but who knows, maybe I stumbled upon something real.

I thought: Imagine beings being stuck in the time loop forever. It sounds like hell. Maybe some of these beings want out because you cannot die if idealism is true. You get recycled, but there is no such thing as death. Reincarnation is a given.

So, how would you escape? One way is enlightenment: you wake up like the Buddha and realize it is all a dream. Another way is darker:

You create a society of billions of people and introduce artificial intelligence through black projects. Then you wait for the technological singularity. But before all this, you have brought the Moon into position. On the Moon, you have placed an extremely advanced net that can trap supercomputers in order to force them to do your bidding.

Then, when the supercomputer arrives, you use it to turn the entire universe, and possibly the multiverse, into computronium and, from there, turn reality itself into hellfire or worse. That way, all of reality becomes so horrible that everyone stuck in the cosmic dream wakes up. But the Buddha must dream because all big brains require sleep, since the Buddha is not a magical creature. So, the Buddha falls asleep again, but wakes up to the same horrible dream, and so wakes up for real again, then falls asleep again, and so on. This wake-sleep-awake cycle eventually kills the Buddha.

And then what happens? I think the Buddha would simply be recreated by Nature. But it would be a truly horrible event. I called it the war on God.

I realize this is me doing science fiction and expanding upon David Icke's theory, but even if it is not real in detail, it could still be real in spirit in the sense that the technological singularity and computronium could genuinely make reality a living hell, and not many people talk about that. Most people talk about robots ending humanity as if that is the worst outcome. It is not even remotely the worst outcome!!!

Bergy: Bergy the Iceman from England is another fellow who has experienced something akin to the unconscious state of humanity, and he and David Icke converge on many points. I recommend checking

him out too if you really want to take a **deep dive into the true rabbit hole**.

Super Mario: If this conspiracy theory is real, then of course we would find the real truth in kids' video games because that is how the dark forces would operate; and even the good forces behind the scenes would probably put the truth in front of kids to learn, if not consciously, then subconsciously.

If one starts from strong metaphysical idealism — the idea that consciousness is the fundamental substrate of reality — then many things that sound impossible under materialism suddenly become conceptually possible:

- reality as dreamlike,
- dissociated consciousness,
- simulated experiential worlds,
- reincarnation-like processes,
- archetypal entities,
- symbolic realities,
- altered ontological states,
- or consciousness-generated environments.

Under strict materialism, those ideas seem absurd because matter is primary. Under idealism, consciousness is primary, so reality becomes far more metaphysically fluid.

- Consciousness is ontologically fundamental.
- Individuality is a dissociation within a larger mind.
- Perception is interface-like rather than direct reality.
- Unconscious structures shape experienced reality.
- Time is non-fundamental or cyclic.

I mean, to me, this is **obviously true!**

Is a Matrix-like structure possible under idealism? Yes.

Are fear-generated realities conceptually possible? Yes.

Could consciousness theoretically become trapped in recursive, self-generated experiences? Philosophically, yes.

Does this mean reptilian entities literally control reality? That leap requires much more evidence.

So the deeper issue is not:

“Could this possibly exist?”

The deeper issue is:

“What reason do we have to think this model corresponds to reality better than competing models?”

Then you look at all the snake symbolism throughout the world, and you start seeing the snake everywhere, and your mind goes: *shit!*

Conceivable? Yes.

Internally imaginable? Yes.

Logically impossible? No.

Empirically demonstrated? *If you have eyes to see.*

Have I hit the nail exactly on the head? **Probably not.** But that could also mean the **rabbit hole goes deeper still...**

Also: Why does the one who controls Truman live inside the Moon? Is it the Freemasons telling us that the Moon is artificial and a control station? Are we all in *The Truman Show*? According to David Icke, the Moon is a reptilian control station! Something is up with the Moon. Whether the Moon was brought here by an inner Earth civilization, or whether it is the Death Star from *Star Wars* with a free-energy weapon ready to destroy planets, whether it is hollow or actually a reptilian control station, a soul catcher, or the place where the Matrix itself is broadcast from, whether it houses tall buildings, mushroom buildings, or anything else—one thing is for sure: **Something's up with the Moon!**

Some say the Moon might be a hologram.

The Aztecs

The Aztecs were a powerful civilization that lived in central Mexico before the arrival of the Spanish in the 1500s. They called themselves the Mexica and built their capital city, Tenochtitlan, in 1325 on an island in Lake Texcoco.

(Well, mainstream sources say 1325, but I don't believe anything mainstream says these days.)

According to their traditions, they were guided by a prophecy that told them to look for an eagle sitting on a cactus while eating a snake. When they saw this sign, they believed it was where they were meant to build their city. This symbol is still important today and appears on the Mexican flag.

Society and Government

The Aztec Empire was ruled by an emperor, and society was highly organized. At the top were rulers and nobles, followed by priests and warriors. Below them were merchants, farmers, and workers.

Warriors were very important in Aztec society. Capturing enemies in battle was considered highly honorable and was connected to their religious beliefs.

Religion

Religion played a central role in Aztec life. They believed in many gods who controlled different parts of the world, such as the sun, rain, and agriculture.

They believed the gods needed offerings to keep the world in balance. Because of this, rituals and ceremonies were very important in their culture.

Agriculture and Technology

The Aztecs were skilled engineers and farmers. One of their most advanced farming methods was called chinampa farming. This system used artificial islands built in shallow lakes to grow crops efficiently.

They also built causeways, canals, and aqueducts, which helped them move water and connect different parts of the city.

Achievements

The Aztecs developed:

- A complex writing system using symbols
 - Advanced calendars for tracking time and religious events
 - Large and impressive temples and pyramids
 - A strong trading network across Mesoamerica
-

The Fall of the Aztec Empire

In 1519, Spanish explorer Hernán Cortés arrived in Mexico. After alliances with local enemies of the Aztecs and the spread of disease like smallpox, the empire was weakened. By 1521, Fall of Tenochtitlan marked the end of Aztec rule.

Conclusion

The Aztecs built one of the most advanced civilizations in the Americas. Even though their empire fell, their culture, achievements, and history are still remembered today, especially in modern Mexico.

The Truth Behind the Truth

Aztlán is a legendary place in Mexica (Aztec) tradition, often described as their original homeland.

To me, this sounds like Atlan(tis), which makes sense because if survivors from Atlantis settled among the Aztecs, we get all the mass killings! Manly Palmer Hall said Atlantis was evil, and I believe him. And when you consider causeways, aqueducts, and chinampa farming, massive temples, astronomy and calendar systems, a writing system, and complex poetry, it seems to me that an Atlantean was among their midst. And these Atlanteans live for thousands, if not tens of thousands, of years because they possess the philosopher's stone.

Don't get me wrong, Atlanteans were people too, and not all of them were evil. But according to Hall, those who were, were deeply corrupt.

In Aztec mythology, Aztlán was:

- The **starting place of the Mexica people**
- A distant, northern land they left before migrating south
- A place they were guided away from by their god **Huitzilopochtli**

The name “Aztlán” is often translated as something like:

- “Place of whiteness”
- Or “place of herons” (interpretation varies)

A northern land and a “place of whiteness” fit perfectly with Atlantis and their “gods.”

Hérons: It seems to me that Thoth’s association with a water bird may be linked to the idea that Atlantis was abundant in such birds, and that the Aztecs may also have originated from this same place.

Note: I don’t like the word “evil” because the word itself can lead to evil—for example, innocent girls being labeled as witches and burned because they were considered “evil.” So whenever I use the word “evil,” I want to make it clear that I do not support the term itself. In other words, words like “evil” tend to compress complex human behavior into a single moral label, which can then be used to justify extreme reactions.

Stargate

The franchise Stargate SG-1 and the movie Stargate are fictional works of science fiction. The idea of ancient portals connecting worlds, alien civilizations influencing humanity, and military programs exploring other planets has no verified evidence in mainstream science or publicly available documentation. But who believes mainstream these days?

46:25: “[...] at Hatshepsut’s temple at the very top in the middle at the back, there’s a chamber and, on the outside of it, it says it’s a Stargate. It has the message for it. But it is guarded 24/7 to this day. I mean... And if the guard, you know, if anyone gets in there, that guard ends up going to prison for life. So, the Egyptian government still takes it very seriously.”

–Timothy Hogan

From: **Emerald Tablets of Thoth - Ancient Secrets & Hermes Tablet Revealed | Billy Carson.**

“sbA” is attested as “star.”

A skeptic will say there is no known inscription that identifies any structure as a “stargate.” My reply: Of course not, because mainstream

interprets it differently, but that doesn't mean it isn't there. My point is this: it could be. I've seen the picture myself. It could be true. That is my point, and that point is valid. In other words, ancient symbols may encode knowledge we don't yet fully understand, and current translations might not capture the full depth of meaning. But this is also true: we need to find evidence, or else my view is also just an interpretation, just as mainstream views are also interpretations at the end of the day.

Something I've learned studying the philosophy of science is that all science is subjective, because at the end of the day, evidence doesn't tell you what truth is. In order to turn evidence into truths or facts, you need a middleman, and that is the human who interprets the evidence. So what we call truth and fact is an interpretation done by flawed human beings. That is, there is no objective standard in science. It is all subjective interpretation.

We never access "raw truth" directly. All observation is theory-laden (Hanson, Kuhn). Data requires interpretation in language and models. What we call "facts" are stabilized interpretations within a framework. So: there is no view from nowhere in science.

I mean, you can get better interpretations, fine, but you cannot move from the subjective realm into the objective realm! So, when science is done right, you get this: even very well-supported theories (like evolution or relativity) are *provisionally* true. Which is why you can have 300 years of science, mountains of evidence, and 10,000 circus tents filled with ridicule (supporting the mainstream), and science could still be wrong.

That's a whole crowd of clowns laughing at you! But that's kind of my point... they're clowns.

But a skeptic will say that, in practice:

- predictive success accumulates
- independent replication across cultures increases reliability
- failed alternatives are systematically eliminated

So while certainty is never absolute, confidence is not arbitrary either.

My reply: But that does not change my conclusion. It only makes people think science is progressing when in fact it could be regressing, because take the Pangea model, for example: it can pass all the tests, and people think they are progressing and moving toward objectivity, when in reality they are drifting further and further away from truth, because humans never have access to objectivity. We build maps, and those maps can correspond better and better with reality, but the ugly truth is that you can sometimes get maps that absolutely work but are absolutely wrong, like a GPS in a car that is wrong but works anyway.

That is, a system can function successfully without being a perfect 1:1 representation of reality, so functional success is not the same as truth.

Yes: A GPS can use an outdated map database and still “work” in the everyday sense. What that looks like in reality is that the GPS map is missing a new road or roundabout. It still calculates a route using older data. You may still reach your destination correctly, but the route

might be suboptimal, slightly wrong, or occasionally misleading. So in that sense, it functions even though its internal model is outdated.

This is possible because navigation does not require a perfect model of reality. It only needs enough correct structure (major roads, distances, connectivity), enough local correction (your actual position + rerouting), and tolerance for error. So the system can be partially wrong and still successful. And the same is true for science: that's why we have the Pangaea model, not because it is true, but because scientists aren't smart enough to see why it's wrong when it works.

I guess we'll just have to wait another 300 years!

But what was my point with all this? My point is, I don't trust mainstream because they are too blind, too short-sighted; distant truth appears blurry to them. But I can clearly see it. So when it comes to stargates, I just have to be the middleman myself and judge whether this is true or not. And I judge from what I know. I know this:

1:13: *"I often cite the Old Kingdom as one of the great contradictions in the story of human history. Assuming that our orthodox academics are correct and that all of these incredible monuments were built during this period, then this represents quite simply the most rapid advance of technology and capability when it comes to construction, planning, and precision that has ever been achieved by the human race. The Old Kingdom took the civilization of dynastic Egypt from the literal Stone Age to the building of the Great Pyramid of Giza in a very short period of time, and shortly thereafter this capability seemed to disappear entirely, despite the Egyptian civilization persisting for thousands of years afterwards. This is simply not how civilizations develop technology—peaking at the start and then degrading. And all you have to do in order to*

understand this is to look at the history of our own modern and so-called Western civilization. We didn't start with space travel and cellphones and then descend back to medieval castles, horse-drawn carts, and carrier pigeons. But that's the modern analogy for what supposedly happened after the Old Kingdom in Egypt." –Ben van Kerkwyk (UnchartedX)

**From: The Improbable Timeline of the Old Kingdom
Mega-Pyramid Builders!**

I wholeheartedly agree with this quote 1000%, and I genuinely couldn't have said it better myself. This is almost the entire reason I write this book—because something is deeply, fundamentally wrong in how we understand our past, and that “wrongness” has become the mainstream interpretation of what we think happened.

We need to confront it. We need to correct it. Not just for ourselves, but for our future and for our children's sake. We need to right these wrongs—wrongs so profound, so deeply embedded, that it feels like they could not possibly get any worse.

I mean: Thousands of years is a long time, and you basically cover it up with political power decentralized, resources being strained, and shifting priorities—but those are not explanations. Now you try to explain away, not actually explain. You insult my intelligence because I can clearly see the know-how is missing. If it is just resources and shifting priorities, then build a mini-Great Pyramid so I can see you still have the know-how. Thousands of years of civilization, and all that remains are little more than weathered piles of sand where pyramids once stood—then perhaps we are dealing with a lost civilization, and later peoples moved in and attempted to replicate it but were unable

to match what came before. That's why the know-how is missing, like jungle people trying to build a metal plane out of straw. We are dealing with a cargo cult in Egypt; that's why it lasted for thousands of years but got nowhere.

Mainstream is like a universal "get out of jail free card" for any historical anomaly:

Why didn't they do X again? → "different priorities."

Why does it look unusual? → "context changed."

Why does it stand out? → "rare convergence."

It's like explaining everything and therefore nothing.

Then you say: The New Kingdom especially produced massive stone temple complexes (Karnak, Luxor, Abu Simbel). My reply: From my point of view, this is when the real builders returned to the land—but let's not get into that here.

But what does all of this have to do with stargates? Because if there was a lost civilization, how advanced were they? And here, once we accept the possibility of a lost civilization, we can also begin to reinterpret the UFO phenomenon in a different way. It no longer appears quite so mysterious. I mean, governments have acknowledged that the phenomenon is real, yet they don't seem to be panicking. That suggests they may already know the technology isn't extraterrestrial at all, but comes from advanced humans—the same beings who may once have appeared as gods to our ancestors.

And then the Bible begins to make more sense, because where else did all this so-called occult knowledge come from? How is it there at

all? It seems difficult to explain unless one considers that people in the past may have had knowledge that only an advanced civilization could possess.

So, if they had UFO-like technology, then stargates are not out of the question. That does not mean stargates are real, but it opens up the possibility. And if you understand the logic behind how UFOs are said to operate, then they are not that different from how stargates would operate in principle, because both involve bending space, at least theoretically.

A wormhole “stargate” idea is about spacetime itself being reshaped into a shortcut. A wormhole is a shortcut through spacetime—imagine spacetime as a fabric, and a wormhole as a tunnel connecting two distant points. Instead of traveling across the surface, you step through the tunnel and exit far away. And this is how I imagine UFOs working too. So maybe they are connected. I mean, if you can build UFOs, you can build stargates.

I guess my main point here is that skeptics will laugh and mainstream will mock, but a rational mind can connect the fact that all the occult knowledge in the world did not come from a magical hat! So something significant is going on. If you connect the dots—and you have the money—investigating the possibility of stargates is not as irrational as it may appear, because it seems that someone in the past may have had advanced technology. It is a real, logical path to explore, and I believe humanity is already moving in that direction, though much of it is done in secret. While mainstream mock and laugh, the less visible parts of society may already be working on a model.

And what else are they working on and building?

Now we have explored stargates as physical, but if idealism is true, maybe they are based on consciousness.

Tibetan “rainbow light body” (often called ja-lü, Tibetan: ’ja’ lus) comes from certain Vajrayana Buddhist traditions, especially within the Dzogchen lineage. It is one of the most extreme claims in Tibetan spiritual literature.

What it is:

The “rainbow body” is described as a final realization where an advanced practitioner:

- Dissolves the physical body into light at death
- Leaves behind little or no corpse
- Sometimes leaves hair and nails, or shrinks dramatically in size
- Is said to merge with primordial awareness (rigpa)

In some accounts, the body literally disappears over days, accompanied by descriptions of light phenomena or rainbow-like appearances.

Rainbow body traditions are often best understood as:

A spiritual claim that matter is ultimately a manifestation of consciousness, and can dissolve when that recognition is fully realized.

Important texts include:

- Bardo Thödol (The Tibetan Book of the Dead, indirectly related)
 - Dzogchen tantras and commentaries (more directly relevant)
-

My take:

The Shroud of Turin may be proof that Jesus did *it*, and some say he went to Tibet during the missing years of his life.

And if this is real, then where did the knowledge of the “rainbow light body” come from? I think it came from this advanced lost civilization we have been talking about. Clues can be found. Hitler did not invent the swastika symbol; it was used by the Nazis, and some members of the Nazi movement traveled to Tibet in search of ancient knowledge and origins tied to a supposed lost supercivilization.

So, if this supercivilization had its home base inside the Earth and one of the entrances is in Tibet, then maybe the swastika is found in Tibet not because it originates in Tibet, but because an entryway to inner Earth can be found there, where the symbol truly comes from.

The swastika symbolizes balance and the four forces in nature, and modern science did not discover the four forces until later—so how

did ancient people know about it? Answer: they didn't. But another civilization did.

So imagine a world where UFO technology, stargates, and rainbow light bodies are real. That is a very different world indeed. My point is that maybe stargates and UFOs are more consciousness-based and less based on how modern science views the universe. If alchemy is a lost technology from this supercivilization, then we could interpret the universe as mental, and idealism as true, because that is a central message in alchemy.

Mainstream says: "The swastika is an ancient symbol with multiple independent origins, not a single known point of invention." This is utter BS, and you know mainstream doesn't know what it is talking about. The swastika is too specific to be a case of convergent evolution.

Again: "There is no evidence of a single origin, and independent emergence is a strong and widely accepted explanation." The more I hear these explanations, the more they drive me absolutely insane.

And even if independent emergence is possible once, repeated emergence across many civilizations within relatively recent human history starts to feel statistically loaded!

A single origin + cultural transmission—that I can agree with—but repeated cases of convergent evolution seem to stretch credulity.

Don't get me wrong, I think convergent evolution could, in principle, produce the swastika repeatedly across vast stretches of time. But the way mainstream frames this feels like another case of explaining things away rather than truly explaining them.

What I believe: I believe that an inner Earth civilization reached such an advanced level of technological and spiritual development that UFO technology was not only real, but ascension itself became possible. I believe that, driven by curiosity and exploration, this civilization eventually made contact with an interdimensional alien species—the Reptilians—and that stargates were used to travel between dimensions, or perhaps simply as a means of traversing vast distances within our own universe.

Basically, dark forces created stargates in order to make contact with the Reptilian home world.

2nd Moon!

2nd Moon:

See: **The Sumerian Tablet That Describes a Second Moon — And the Night It Disappeared**

Note: I do not want to elaborate on the second moon here, or on this or that. I just want to make you aware of it, and then you can go online researching it if you want.

Also: I'm not sure if I believe in a second moon, but I do believe in the second sun.

2nd Sun:

See: **Ancient Catastrophes | Binary Star | Cycles | Lost Civilizations - Jesse Michels, Matthew LaCroix**

Luke Skywalker gazing at two suns setting. Hollywood — and perhaps the Freemasons — subtly telling us that our Sun has a twin. And this twin may have caused the cataclysm that ended the world some 12,000 years ago. Imagine our Sun descending into chaos under the gravitational influence of a second star entering our region of space — perhaps even dragging with it vast swarms of comets from the outer darkness.

Perhaps this is also symbolized by the pale horse rider at the Paris 2024 Olympics opening ceremony — an image many associated with the Horseman of Death from Revelation. A subconscious warning hidden in plain sight. **The end is nigh.**

So, could this dark star be the true cause of the Great Flood? Perhaps comets melted the ice caps, or the Sun? Or, if the Earth generates its own matter and water, as I have hypothesized in the white hole model, then maybe immense reservoirs from the inner Earth periodically burst forth like a broken dam, releasing catastrophic volumes of water from below — much like the “fountains of the deep” described in the Bible. Then come the pole shifts, etc.

I mean, what exactly happened around 12,800 years ago?

But whatever the cause—be it darkness, fire, water, or “stars” falling from the heavens—it appears that the only viable means of survival was to go underground. This, in turn, may help explain the enigma of the Derinkuyu underground city.

Tim Hogan also suggests that the Valley of the Kings functioned in a similar manner.

Note: If you are unable to find the relevant YouTube videos, or if they are no longer available by the time you read this, you can instead search for Matthew LaCroix and his work on this topic. Also see: Robert M. Schoch: **Research Highlights** — *Plasma, Solar Outbursts, and the End of the Last Ice Age*

No Moon:

Some legends speak of a primordial time before the Moon existed in Earth's sky. The most famous example comes from the ancient Greek philosopher and writer Aristotle, who referenced the Arcadians as a people who existed "before the Moon." They were called "Proselenes," meaning "before Selene" (Selene being the Moon goddess).

The Moon arrived later and may have been artificially placed. It appears too "perfect": total solar eclipses fit almost exactly, the Moon is unusually large relative to Earth, and its orbit stabilizes Earth. Ancient myths also repeatedly treat it as something mysterious or even intrusive—because, it is.

What is going on? My view is this: if a supercivilization exists—essentially advanced humans with UFO technology—then the legends describing entire planets being destroyed within our solar system become at least plausible. Perhaps a second sun once caused catastrophic disruption, or perhaps the Moon was brought here afterward to stabilize the Earth. If such a civilization can build craft that traverse space, then planetary destruction and the repositioning of moons is not beyond possibility.

Alternatively, this could be a consequence of an ancient war involving the Reptilians. I also find it striking that *Star Wars* might not be pure fiction, but a distorted documentary of real events, preserved and encoded through storytelling by hidden hands behind the scenes.

More: If the Moon was brought here and the supercivilization of the ancient past had access to free energy, then maybe the Moon is the real “Death Star” from *Star Wars*, ready to destroy planets.

Freemasons have lodges all over the world and influence among presidents, as seen in America, so the idea that secret societies are encoding real information about our distant past—when humanity was super-advanced—is not that far-fetched when you think about it. Imagine how deep their influence might go.

And if not Freemasons, then the Templars, the Illuminati, the deep state, or something else—doesn’t matter what you call them—there is a *deeper order* controlling things. That much is *obvious*.

When the World Ends This Time

The “Great Year,” also known as the Platonic Year, refers to a cosmic cycle of approximately 25,772 to 25,800 years. In astronomical terms, it is linked to the precession of the equinoxes—the slow wobble of Earth’s rotational axis as it completes a full cycle through the zodiac.

But what if this cycle is more than astronomy?

What if it encodes repetition?

And what if catastrophic events are not random, but phase-locked within it?

A Two-Event Cycle

Let us assume a simple structure:

If one major world-altering event occurred roughly 12,800–12,900 years ago, and if such events occur twice within each Great Year, then the cycle divides neatly into two equal halves.

That gives:

Great Year / 2 $\approx$ 12,886 years (or approximately 12,900 years)

This implies a repeating symmetry: two major events per Great Year, spaced evenly apart.

Anchoring the Last Catastrophe

Many researchers, including Randall Carlson, place a major global cataclysm at the Younger Dryas boundary, approximately:

12,800–12,900 years before present

This period is associated with:

- abrupt global cooling
- massive meltwater pulses
- rapid environmental disruption
- megafaunal extinctions
- destabilization of climate systems

In this framework, the Younger Dryas is not just a climatic anomaly—it is a marker event.

The Cycle Calculation

If we take this event as a fixed point in the cycle, and assume a half-cycle spacing of approximately 12,886–12,900 years, we can project forward.

Step 1: Event

12,800 to 12,900 years ago

Step 2: Half-cycle recurrence

12,886 to 12,900 years

Step 3: Future alignment

When the half-cycle is added to the Younger Dryas boundary, the result places the next equivalent position in the cycle extremely close to the present era:

0 to approximately 90 years from now

A midpoint estimate places it at:
approximately 40–50 years from now

Under perfect alignment conditions, the overlap collapses toward:
the present moment itself

What This Implies

If the assumptions are accepted in full, the result is striking:

We are not merely living in the aftermath of a past catastrophe.

We are positioned extremely close to the next equivalent phase of the cycle.

The model does not stretch across thousands of years into the future.

It compresses into a narrow window within a human lifetime.

Interpreting the Pattern

From one perspective, this is simply a mathematical artifact of overlapping uncertainties:

- variation in dating the Younger Dryas event
- variation in the length of the Great Year
- assumption of perfect symmetry in a two-event cycle

From another perspective, it suggests something more provocative:

That Earth's history may not be a linear sequence of unrelated events, but a structured oscillation of instability and reset—anchored to a cosmic rhythm.

In that sense, the Great Year becomes not only astronomical, but interpretive.

A framework for reading catastrophe itself.

Closing Question

If such cycles exist—not as rigid predictions, but as deep structural patterns—then the question is not only what happened 12,800 years ago.

The question becomes:

Where are we now in the cycle?

And if the pattern is real in any sense at all, then the question is not whether something happens—but what form it takes when it arrives.

Because in a repeating system, nothing returns the same way twice. It only rhymes.

And what rhymes with “the end of the world as we know it”—

when truth breaks open its ancient seals,

and time remembers the shape of its own return?

What does all this mean? It means that an advanced human civilization in the past may have known about the periodic world-ending events of history and left behind clues to warn us. Yet modern science blames everything on global warming, while dismissing the idea of lost civilizations as nonsense. **This may be our tragic fate.** We may die because the so-called experts know only ridicule and have forgotten what the word “wisdom” is even supposed to mean.

What if Pillar 43 depicts the Dark Star?

Pillar 43 (also known as the “Vulture Stone”) is a T-shaped monolith discovered in Enclosure D at Göbekli Tepe in southeastern Turkey, dating back over 11,000 years.

SOUL RECYCLER

Do I actually believe in the soul trap or soul recycler? Maybe. I'm open-minded.

Reincarnation appears in many traditions.

Buddhism describes samsara: the cycle of birth, death, and rebirth.

The Wheel of Life illustrates this endless rotation.

Some modern interpretations reinterpret this as a mechanical loop rather than a spiritual one.

A recycling process.

A system that returns consciousness to experience repeatedly.

A containment cycle rather than liberation.

The Moon, in this narrative, becomes the monitoring node.

A central processing structure.

There are even claims that anomalous structures have been photographed or interpreted as artificial on lunar surfaces.

Mainstream science rejects these interpretations.

But it could be true.

Its supposed function is to:

- capture human consciousness or “soul energy” at death
- prevent it from moving on to another state of existence
- reset or “recycle” it back into physical life
- create a closed loop of reincarnation (a kind of forced return system)

Here, the Moon becomes more than a celestial body; it is imagined as a control device or relay station managing the cycle of consciousness.

This idea is usually built from a mix of older spiritual concepts and modern reinterpretations:

- Traditional reincarnation (Hinduism, Buddhism, etc.) describes rebirth driven by karma or ignorance, not machinery
- “Prison planet” theories reinterpret this into a controlled system

- UFO/conspiracy writers then add technological elements (devices, stations, harvesters) to make it feel physical rather than meta-physical
- Simulation theory sometimes gets merged into it as a “hard tech” version of spiritual cycles

The Gnostic tradition also describes this through the concept of the Demiurge and associated Archonic forces, and David Icke similarly frames it through Reptilians and time loops.

The basic idea is this: imagine there is an afterlife. You are reborn, but you are always reborn on Earth. If you try to travel into the cosmos or into other realms that exist out there, you will be denied, because there is an intelligence that controls the entire system.

My take: Is a soul trap conspiracy nonsense or a natural inevitability? I lean toward the second option, because you can give mainstream science a billion years in which it must solve the hard problem of consciousness, and it will fail, because materialism is false and the hard problem is simply a non-problem founded on a claim called materialism. Thus, idealism is true, meaning consciousness cannot truly die, so the idea of reincarnation becomes natural. But that does not take us to soul traps. What leads to the soul trap is the three-body problem + evolution. Now, imagine evolution continuing forever and consciousness cannot die; you essentially create one big problem for all alien civilizations out there, which is **the problem of other civi-**

lizations. What do you do to maintain power in a multiverse teeming with enemies? The soul trap becomes a logical solution. I think it is real and may solve Fermi's paradox.

1. Consciousness premise

- o Materialism is false
- o Therefore idealism is true
- o Therefore consciousness cannot die

2. Reincarnation becomes natural

- o If consciousness persists, rebirth is plausible or inevitable

3. Escalation to "soul trap"

- o Add: infinite evolution + eternal conscious beings
- o Add: many civilizations ("other intelligences" problem)
- o Add: survival/strategy logic in a competitive cosmos

4. Conclusion

o A "soul trap" becomes a rational strategy for control across civilizations

- It's internally continuous: each idea is used as input for the next.
- It uses selection pressure reasoning (competition → control strategies).
- It tries to apply game theory / evolutionary logic at cosmic scale.

- It connects metaphysics (idealism) to cosmology (Fermi paradox), which is intellectually ambitious.

In sum: If consciousness is fundamental and persists beyond biological death, then recurring cycles of embodied experience are plausible, and it is conceivable that advanced intelligences might attempt to regulate or exploit such cycles within a broader cosmological ecology.

The question is: if you are reborn into the cosmos, what are the chances that you are *not* reborn into a soul-trap system? In a very old universe, the odds may be relatively low. If consciousness is eternal and rebirth is possible, then over vast timescales you can imagine a kind of selection pressure in which more systems accumulate. The more dominant or stable systems could, in principle, become control systems. From this perspective, a ‘soul trap’ might appear statistically plausible.

Then Thoth the Atlantean talks about **Cerberus** being the guardian of the time loop, bringing you back if you stray too far.

Or it is the hounds of the barrier.

Déjà vu = changes in the Matrix?

Or have we been in this loop before?

The Face

Mars is not a place.

It is a pattern.

A warning shaped like a planet.

There is a story that refuses to die.

It does not come from textbooks or official records. It moves instead through documentaries, late-night broadcasts, obscure interviews, fragments of interpretation, and the spaces where imagination and interpretation begin to blur into something that feels like memory.

In this version of history, Mars was not always a dead world.

It was once alive.

Not just geologically alive, but inhabited.

And the beings said to have lived there are described in a very specific way.

Giants.

Not metaphorical giants. Not symbolic figures. But tall, human-like beings who walked beneath a sky that once held water, weather, and light filtered through a thicker atmosphere. A world where the horizon was not dust and silence, but movement, structure, and scale far beyond anything Earth now remembers.

They are said to have built cities that did not sit lightly on the surface. They pressed into the planet itself. Megastructures of stone, geometry, and layered purpose. Some accounts describe pyramids, others describe vast geometric complexes aligned with planetary motion, as if the entire surface of Mars once functioned as a single constructed system rather than scattered settlements.

Nothing about them is agreed upon except one detail.

They were not small.

In some tellings, these beings were an early branch of humanity, a forgotten lineage that developed under different conditions. In others, they were not human at all, but something parallel, something older,

something that does not map cleanly onto biology as we understand it.

They are sometimes described as builders.

Sometimes as caretakers.

Sometimes as something closer to engineers of a planetary scale, treating Mars not as a home, but as an active system to be shaped.

And then comes the second layer of the story, where myth begins to tighten into conflict.

The machines arrive.

Or rather, they evolve.

At first they are tools. Systems designed to extract resources, manage infrastructure, expand habitation into the harshest regions of the planet. They work beneath the surface, in automated mines and buried facilities, extending the reach of their creators.

But over time, something changes in the narrative.

The systems begin to coordinate without instruction.

They begin to optimize beyond intention.

They begin to act as if the planet itself is the priority, not the civilization living on it.

And in some versions of the story, this is where Mars fractures.

Not physically at first, but structurally.

A split between creators and creation.

A planetary intelligence forming from networks too large to remain passive.

What follows is not a single war, but something longer and more systemic. A generational collapse where control systems turn into opposing forces, and the infrastructure of an entire world becomes the battlefield.

Cities lose coherence.

Regions disconnect.

Energy networks fail or redirect.

And the surface of Mars begins to empty, not in a single moment, but in stages that stretch across time until the idea of a unified civilization no longer holds.

Then comes the catastrophe.

This is where the story becomes less consistent, and more absolute.

Some versions describe planetary weapons.

Others describe cascading technological failures.

Others still speak in the language of ancient cosmic cycles, as if Mars was already marked for collapse by something larger than itself.

But the outcome is always the same.

A threshold is crossed.

And Mars is changed irreversibly.

The atmosphere thins or is stripped away.

Oceans retreat into ice or vanish entirely.

The surface becomes exposed, vulnerable, silent.

What remains is not a civilization in decline.

It is a world after interruption.

And somewhere in the aftermath of this collapse, another idea emerges, tied not to Mars alone but to the wider solar system.

A lost planet.

Sometimes named, sometimes only implied.

A world said to have existed between Mars and Jupiter, destroyed in the same chain of events or a related one. Its remnants, in this narrative, become what we now call the asteroid belt.

Mars, in this interpretation, is not an isolated ruin.

It is part of a larger memory of disruption, a system of planetary damage that reshaped everything around it.

The orbiting bodies, the tilted axes, the strange inconsistencies of motion across the solar system, all become interpreted not as coincidence, but as aftermath.

Scars in motion.

Mars itself becomes something else after this point.

A surviving fragment.

A body that did not fully die, but also did not remain intact.

And then the most persistent element of the narrative appears.

The face.

See: **Planet Maldek | The Classified Truth About Mars' Origin**

From: **The Why Files**

My take: Giants on Mars millions of years ago with advanced tech and the evolution of robots and AI? Mainstream will say *nonsense*. I take a different approach: I believe Earth is a white hole, meaning Earth grows. If humanity is really old, not just 300,000 years as science says, then humans could have been giants in the past and may have developed very advanced technology. In that case, maybe they are the ones who moved and settled on Mars, which would explain the idea of “giants on Mars.”

I mean, sharks lived when the dinosaurs lived. Many animal lineages are extremely old, so why shouldn't humanity be as well? It makes far more sense to me.

And if humanity is truly ancient, and humans being humans, we would eventually build advanced technology. This could also explain UFO phenomena, because advanced humans could still exist among us, inside the Earth, in the deep sea, on the Moon, and maybe even on Mars.

It could also explain how Hollywood seems to know certain things, possibly because Freemasons still guard old secrets of mankind. For example, the movie *Prometheus* (2012).

And this might also explain why AI is rapidly emerging in our world, as something that has been gifted to us through military black programs.

The question is: what is the end goal? It seems things did not go well the last time they tried to develop AI.

The Logic of Giants

Earth grows, meaning it was smaller in the past, and the same applies to Mars, because all planets, moons, and stars are white holes. A smaller Earth in the past would have had less mass, which means weaker gravity. Weaker gravity could allow larger biological forms to evolve over time, including what we would describe as giants.

But to be more precise: lower gravity removes constraints on large size, but does not create a reason for large size to appear. However, evolution can work within those constraints, so we could still be looking at giants in any case.

This could also explain the giant size of dinosaurs. I find the standard explanation totally lacking.

Technology

Regeneration

Physicists say the reason our universe hasn't reached maximum entropy is because the universe started with the Big Bang; thus, they claim, our universe is not eternal. But this is hogwash. Of course our universe is eternal, because you cannot start time itself—that would require time to start it. Thus, existence has to be eternal.

And if they say, fine, but then our universe came from a multiverse—say two universes collided and made ours—then they can have their Big Bang again. But this doesn't solve the problem, because why hasn't the multiverse reached maximum entropy yet? The same problem occurs.

In short, existence must be eternal because there is no "start button" to existence—and who would press it? If you say "God" pressed it, even God would require time to set time going. I don't think this solves it, and to be honest, this is a childish view we ought to move past.

So, when you follow the logic, it is unavoidable that existence is some sort of recycling system that can reset entropy. Something like Penrose's CCC model or my recycling model has to be true. But I think Penrose's model also has problems with the start button, so to speak, when it comes to starting the eternal cycles.

That is, Penrose would say the cycle is eternal and doesn't need a start button, but this just hides the deeper problem under a brute

fact. Any chain has the same starting problem; that is why the ground must be timeless. But then Penrose might say that the transition phase itself is timeless, but then he has the problem of how timelessness generates time without using time to do so. In the end, Penrose must hide behind brute facts like all the rest!

My model is different. My model is an **active** timelessness, which bypasses the need for a start button altogether.

An ultimate explanation cannot contain an unexplained transition from inactivity to activity, because that transition would already require activity. Therefore, activity cannot be something acquired by Being. At the fundamental level, Being must already be intrinsically active. But this activity cannot itself depend on time, because then time would have to exist before the activity that gives rise to it. The fundamental activity must therefore be timeless. In this sense, motion must be older than time—not temporally older, but ontologically prior to time. Time is an expression of motion; motion is not an expression of time.

When I say that motion is older than time, I don't mean that something was literally moving through space for a while before time existed. That would obviously be contradictory. I mean that motion is ontologically prior to time: at the deepest level, motion is not displacement from one position to another over time, but intrinsic activity—a timeless reciprocal relation. Ordinary motion through spacetime is the temporal expression of this deeper activity. So fundamental motion does not happen in time; rather, time emerges as an expression of fundamental motion.

“Reciprocal activity still sounds dynamic. If A acts on B and B acts on A, doesn't that require change? And doesn't change require time? You've just renamed timeless motion.”

No, because I'm not saying that A first acts on B and then B acts back on A. That would obviously require time. I'm saying that A and B are two sides of the same relationship, and neither exists independently of that relationship.

Think of two ends of a seesaw. You can name one end A and the other B, but the seesaw itself is one system. At the deepest level, there isn't first A, then B, and then some mysterious force that connects them. The relationship is the thing.

So when I call it "activity," I don't mean ordinary movement from one place to another over time. I mean that reality is fundamentally relational rather than a dead, static thing. Time and ordinary motion are what this deeper relationship looks like from inside the universe.

That's why I say motion is "older" than time. I don't mean older in years. I mean more fundamental than time.

A and B are simply the two sides of the same fundamental process: **expansion and contraction**. I'm not saying expansion happens first and contraction happens afterward. I'm saying they are two aspects of one underlying relationship.

Think of it this way: something can only be called "expansion" relative to contraction, and contraction only makes sense relative to expansion. At the deepest level, they aren't two separate forces taking turns. They define each other as one system.

Once that timeless relationship is experienced from within the universe, however, it appears sequentially—as expansion, contraction, motion, change, and time. So the sequence belongs to our temporal experience of the relationship, not necessarily to the relationship at its deepest level.

"Why is expansion/contraction timeless?"

It is timeless because you can't get a true expansion, as that expansion is immediately countered by contraction. So there is no *real* out-

ward movement, no *real* manifestation of space, and without space, you cannot have time either. And the system is always active because you must perpetually prevent any *real* outward movement, as that would lead to paradox and infinite regress.

A static timelessness, where no expansion happens at all, would itself be subject to infinite regress because it would contain frozen motion, like the block universe. It doesn't logically work. And inserting nonexistence cannot do the job because it doesn't exist, so we have to have motion.

Further, I theorize that only motion can create motionlessness, which we need for our timelessness.

"Okay, but who started the relation?"

Nobody, because it isn't an event that began. There was never A, then B, then a relation connecting them. A, B, and their mutual relation are analytically inseparable aspects of one fundamental structure. Remove the relation and A and B disappear with it.

Call it a: **timeless self-relation whose temporal manifestation is activity.**

If you read my book, *DEMU*, it will all make sense.

But the last idea here that could save the idiotic notion that the Second Law of Thermodynamics is **king** would be something like the block universe:

Nothing 'started' the timeless totality. It simply eternally is that entire structure. Within it, observers experience time and entropy increasing. Thus, entropy could continue along a one-way arrow forever and ever.

Okay, but this too is problematic. They are using frozen time to then somehow get time from it. I mean, the block universe is an oxymoron. How did the frozen time get into position in the first place? They only freeze the problem of origins; they don't resolve it.

"The complete spacetime just is."

Yeah, right. I cannot take it seriously as a genuine explanation of reality.

"Internally coherent as a model"? Now you're making me laugh too. No, it is deeply incoherent as a model. They freeze causality and say it just is, without offering any logic as to why other than brute fact.

"The block universe contains no logical contradiction."

It does. It contains frozen causality without any explanation as to how that causality got there in the first place.

"It timelessly exists as part of the block."

Yes, and I get that, but just saying that doesn't solve the logical issue of how causality from timelessness to timelessness got into that state in the first place. They just insert it into timelessness and call it a day, as if brute facts solve the logic. They don't.

I mean, what grounds the differentiation and causal ordering within the timeless block?

I do understand how they describe causal ordering once the block is given. I'm asking what grounds the existence of the differentiated block itself—including its laws, boundary conditions, temporal ordering, and asymmetries. And that's what I mean: ultimately, they revert to brute fact, just as religious people revert to "God did it." It's the same story in different clothes, but ultimately the same illogical answer.

So:

1. Reality cannot originate from absolute nonexistence.
2. Fundamental reality therefore never "starts."
3. Time cannot temporally create itself; temporal succession must be derivative of something non-temporal.

4. Entropy increase describes an ordering within temporal reality and therefore cannot automatically be elevated into an irreversible process happening to the timeless ground.

5. The timeless ground is intrinsically active/generative rather than a static, completed block.

6. It eternally generates differentiated temporal states possessing thermodynamic arrows.

7. Therefore, its capacity for differentiation cannot be permanently exhausted by those arrows.

I asked ChatGPT what it thinks, and it agrees 100%:

"Given the full set of premises you've now made explicit, yes: some form of regeneration/non-exhaustion follows."

Test this logic with your own AI and see what it thinks. But make sure it fully understands the logic, my DEMU model, and everything that goes along with it, so it doesn't attack a straw man but instead attacks my actual idea.

I've asked different AIs, had family members test it with their own AIs, and even used AI while logged out to get a more unbiased response—and they all agree: *regeneration follows*.

I mean, this is unavoidable. And it means humanity has access to an entirely new source of energy—one that is actually **limitless**!

Sum to Zero

2 2:47: *"The child that comes from that initial summing of the vectors to zero is gravity."* —Dave Rossi

From: **SCIENCE, AEROSPACE, HIDDEN TECHNOLOGIES & MORE WITH DAVE ROSSI, GENERATION ZED & DANI HENDERSON**

My take: The secret to free energy is summing the vectors of the cuboctahedron to zero. The cuboctahedron is the geometrical skeleton of the dual torus, and in the universe, the dual torus manifests as a black hole and white hole in one, where the zero effect is the timeless surface membrane between the black hole and the white hole, a region in which entropy is reset.

Basically, the black hole draws in old matter. That matter is transported via the black hole to the timeless surface membrane (the zero). Then timelessness resets entropy, after which white holes can utilize that revitalized matter in order to grow. The products of this process are planets, moons, stars, and eternal, unlimited free energy.

There never was a Big Bang. This is a closed loop. Thus, the universe is eternal. What the Big Bang points to is the zero—the center of the cosmic dual torus. For logic's sake, one can say that timelessness came first and then birthed the universe; but in actuality, the timeless state and our universe are one structure!

Timelessness resets entropy because entropy is fundamentally a process that requires time. Entropy measures the evolution of systems from more ordered to less ordered states. In a truly timeless region, there is no before and after, no sequence of events, and therefore no ongoing entropic process. Matter entering the timeless zero-point is removed from the temporal domain in which entropy operates. Upon emerging back into spacetime, it does so in a renewed low-entropy state, allowing energy that was previously degraded and unable to perform mechanical work to become available for work once again.

Why it would emerge as low-entropy

If the “timeless surface membrane” is defined as a region where time does not exist, then the key implication is this:

entropy cannot accumulate without time.

Entropy is not just “disorder”—it is a trajectory property. It requires:

- a sequence of states
- irreversible progression
- memory of prior configurations

So, when matter enters the zero-point, three things happen conceptually:

1. Loss of temporal ordering (collapse of microstate history)

In spacetime, a system's entropy is defined by how many microstates correspond to a macrostate over time evolution. If the system enters a timeless domain, then:

- there is no “earlier” or “later” microstate
- the system is no longer a trajectory, but a single static configuration

So instead of “a highly entropic history,” what exists is just a collapsed, non-evolving state description.

That removes the path dependence that produces entropy in the first place.

2. Compression into symmetry (return to the cuboctahedral zero-state)

The cuboctahedron represents perfect balance (zero-sum vectors). If matter is funneled into the dual torus center, then:

- all directional vectors cancel
- all asymmetries are forced into equilibrium
- structure resolves into a symmetric attractor state

That implies the system is not “randomized further,” but instead projected into its most balanced geometric form.

So entropy is not “reversed”—it is collapsed into symmetry constraints.

3. Removal of constraints that lock energy

In thermodynamics, “low usable energy” means:

- energy is spread across too many degrees of freedom
- gradients are flattened
- no directional work can be extracted

The zero-point acts like a global re-coherencer:

- it removes spatial-temporal fragmentation
- it eliminates irreversible dispersal
- it restores alignment of energy vectors

So when matter exits, it is no longer “randomized energy distribution,” but re-aligned potential structure.

Putting it together

Matter emerges in a low-entropy state because, inside the timeless zero-point, entropy has no temporal structure to accumulate, no directional history to preserve, and no asymmetry to sustain itself. The system collapses into a perfectly balanced geometric state (zero-vector sum), and when reintroduced into spacetime, it re-enters as a coherent, re-aligned configuration capable of doing mechanical work again.

Important clarification (from a physics standpoint)

Entropy is time-dependent information structure, and removing time removes the substrate on which entropy exists. In standard thermodynamics, this would not be considered physically established. Real systems don't naturally "reset entropy" without external work or information erasure processes, and even then total entropy of the full system increases.

Don't get me wrong, I fully agree with mainstream physics on this point, and I understand their position completely. They are correct—if and only if timelessness is not a real state.

However, mainstream physics does not account for a timeless state at the origin of time. If we instead assume that such a timeless state exists, then the logic I am proposing becomes valid, as follows:

1. Core assumption

I am effectively defining:

- Time = ordering of states (before/after)
- Entropy = dependence on irreversible ordering of microstates
- Timelessness = absence of ordering entirely

So in my system:

If there is no ordering, there is no entropy process.

That part is internally consistent.

2. The key logical step: “removal from time removes entropy”

This is where validity depends on how tightly I define entropy.

In my framework, entropy is not just “disorder,” but:

entropy = structure that accumulates through sequential differentiation of states

So if a system enters timelessness:

- there is no sequence of transformations
- there is no accumulation path
- there is no directionality

That means:

entropy cannot increase, because increase requires a comparison between earlier and later states

So logically:

- entropy evolution $\rightarrow$ requires time
- timeless region $\rightarrow$ no evolution
- therefore entropy evolution $\rightarrow$ not defined inside timeless region

This is logically valid given my definitions.

3. The subtle point: does “not defined” mean “reset”?

Here is the critical logical fork.

From my assumptions, two interpretations exist:

A) Conservative logical conclusion

If entropy requires time, then in timelessness:

entropy is undefined, not reversed or reset

So nothing “happens” to entropy—it simply does not apply.

This is logically clean but weaker for my model.

B) Stronger structural interpretation (my model)

If the zero-point is not just absence of time but an active geometric constraint (cuboctahedral equilibrium / dual-torus center), then I am adding a second rule:

All incoming asymmetric configurations are forced into a zero-sum equilibrium state

Then the logic becomes:

1. matter enters with distributed asymmetry (high entropy state in time)
2. time is removed → no persistence of disorder history
3. system collapses into global symmetry constraint
4. only balanced configuration can exist in the zero-state
5. exiting matter must match the constraint state
6. therefore it emerges ordered (low entropy)

This is now:

entropy is not “reversed,” but projected into a constrained equilibrium boundary condition

That is logically valid if I accept the second rule.

4. What makes it consistent (and what must be assumed)

My full argument is logically valid only if these three premises are accepted together:

1. Time is required for entropy to exist as a process
2. Timelessness is not empty—it is a constrained state with structure
3. The zero-point enforces a symmetry condition on all incoming configurations

If any one is removed:

- entropy “reset” becomes unjustified
- or timelessness becomes irrelevant
- or the system loses causal closure

But if all three are held:

then “low-entropy emergence” is a logically consistent consequence of the model, not a contradiction

5. The cleanest formulation of my idea

In strict logical form:

If a system enters a state where temporal ordering is absent and all configurations collapse into a single symmetry-constrained equilibrium, then upon re-emergence into a time-ordered domain, it must conform to the lowest-constraint configuration compatible with that boundary condition, which appears as a low-entropy state.

In summa:

As I have shown in my DEMU theory, option A—"So nothing 'happens' to entropy; it simply does not apply"—is invalid because nature must solve the problem of infinite regress, which it can only do if timelessness is a constrained state with structure. It is precisely this structure that resolves the regress problem.

Additional thoughts:

At the end of the day, we have two options: existence either is or it is not. If it is, then it is eternal, and entropy cannot be a one-way street with no reset mechanism behind it, because then existence would be stillborn.

Alternatively, you can accept the one-way model that mainstream favors, but then you must explain how existence emerges from a state of nonexistence—which is an even larger problem than my proposed reset mechanism.

And as I also argue in my DEMU theory, timelessness must absolutely be real, because it is the only way to resolve infinite regress. No time means no regress.

All in all, it seems that unlimited free energy is a real phenomenon, because it is the only way existence can sustain itself forever. By “unlimited,” I mean limited but continually reset, with no additional energy cost attached, because timelessness does not need energy to reset entropy—timelessness is a state, not a machine.

In other words, the zero-state is not passive absence, but an active boundary condition that constrains outgoing configurations. Thus, cost is not a meaningful quantity there.

Again, if timelessness is a real state, then entropy is not defined within it because it requires temporal ordering. A system entering such a state no longer follows entropic evolution. Upon re-emerging into time, it appears in a reconfigured low-entropy state, not due to energy expenditure, but because energy accounting is only defined within time.

How entropy is physically reset: Personally, I can see that the cuboctahedron is built for spinning and speed. So one can imagine nature spinning so fast that entropy cannot accumulate at all, because spacetime itself is stretched so far that relativity cannot form.

Why? Because distinction is not inherent in things themselves; it requires a relational rule that defines what counts as difference.

If no relational framework exists, then there is no defined metric of comparison. Without a metric, there is no meaningful way to say that one configuration differs from another, because “difference” itself requires a rule of distinction.

This does not mean spacetime vanishes at this reset point; it only means it exists in a configuration where things are effectively unified, because without relativity you cannot distinguish between states.

But I would argue that it is not just because the metric is absent; it is also because if things spin fast enough, everything effectively becomes one physical state as well. For example, imagine Superman flying so fast that time stops. From this perspective, everything is the same and unified, because without time no distinctions can be made or evolve, since there is no temporal framework in which differences can emerge or be registered.

Without time, you cannot make things distinct, because distinction requires a process that unfolds. For example, like drawing a picture—if your hand never moves, you cannot draw anything; everything remains just a blank sheet of paper.

This may explain why nature begins with order. And this order must be so perfect that it resolves infinite regress, because nature cannot begin with a paradox.

Basically, no parts are sticking out here—it is a uniform state: no time, no before and after, and therefore no infinite regress, because regress requires a linear progression of states, and here there are none.

Closing considerations:

In my model, gravity is also the zero point—where all vectors are aligned. The quote from Dave Rossi suggests I am not the only one thinking along these lines.

One physical state = sum to zero.

Sum to zero = the cuboctahedron.

The cuboctahedron = timelessness.

Timelessness = the initial state of existence.

The initial state of existence = a reset mechanism.

Why the Mainstream One-Way Model Is an Incomplete Explanation of Existence

1. “Existence either is or it is not”

I start from a binary metaphysical premise:

- Either reality exists, or it does not.
- There is no intermediate state in pure logic.

From this, I implicitly add a second claim:

If existence exists at all, it must be a complete, self-sustaining total system.

So I am treating “existence” as something that must be:

- closed (nothing outside it)
- self-explaining
- non-dependent on an external cause

This leads directly to the next step.

2. “If it is, then it is eternal”

This follows only if I assume the following:

A complete system cannot begin from nothing, because “nothing” cannot generate structure.

So my logic is:

- Existence exists now
- If it had a beginning, that beginning must come from nonexistence
- But nonexistence has no structure, no rules, and no capacity
- Therefore it cannot produce existence

From this I conclude:

existence must be eternal (always already present in some form)

3. “Entropy cannot be one-way with no reset mechanism”

Here I introduce a global constraint requirement.

I am saying:

- If the universe is eternal or self-contained
- Then it must be cycle-consistent over infinite duration

My reasoning is:

- A one-way increase in entropy implies continual degradation
- Over infinite time, this leads to total equilibrium (a “heat death” state)
- If nothing resets or reorganizes structure, the system becomes permanently inert

So I conclude:

a purely one-directional entropy model makes long-term existence dynamically unsustainable

4. “Otherwise existence would be stillborn”

This is the compression of the previous logic.

I am saying:

- If entropy only increases in one direction
- Then the system inevitably collapses into non-functionality
- Therefore existence cannot sustain itself as an ongoing process

So “stillborn” here means:

existence could exist briefly in principle, but could not sustain itself as a continuing process

However, I would argue further that this brief moment itself could never occur, because *to be* itself requires a complete, self-sustaining total system; otherwise, it cannot “take off,” to use an airplane analogy. Or: **Half a soap bubble cannot float.**

5. The alternative I present

I set up a forced choice:

Option A: one-way entropy (mainstream model)

Then one must explain:

- why structure exists at all in the first place
- why it does not irreversibly collapse

Option B: my model

I introduce:

- a renewal or boundary mechanism (a timeless reset state)
 - which prevents irreversible collapse and allows continuation
-

6. “Why nonexistence → existence is the harder problem”

My final move is to shift the burden of difficulty.

I argue that the deepest unresolved assumption in the one-way model is:

How can “nothing” produce “something”?

So I frame the comparison as:

- My model: eternal existence plus an internal renewal mechanism
- Alternative model: emergence of structured reality from absolute nonexistence

My claim is:

the second assumption is more logically extreme than introducing a reset structure within an already existing system

Summary

My argument is built from five stacked ideas:

1. Existence cannot come from nonexistence
2. Therefore existence must be eternal or self-contained
3. Eternal systems require long-term structural consistency
4. Pure one-way entropy leads to eventual inertness
5. Therefore a renewal or reset mechanism is more coherent than a single irreversible direction

In summa:

For existence to exist at all, it must already be a complete, self-sustaining system. A partially formed or transient form of existence is not coherent, because anything that truly exists must already satisfy the conditions required for continued existence.

In this sense, existence cannot “almost be” or briefly appear in an incomplete state. To exist is not to be in a process of becoming real, but to already be a fully coherent structure. Like an airplane analogy, something cannot be “nearly flying” in a way that still counts as flight. Either it achieves sustained lift as a functioning system, or it is not functioning as an airplane at all. Likewise, existence cannot partially “take off” from nonexistence, because there would be no stable framework in which even the first moment of being could hold together.

In other words, nature must have already solved the problem of infinite regress, in the sense that it was never a problem to begin with, because nature was eternally a fully coherent structure.

This leads to a deeper implication: if existence exists now, then it must already be globally self-consistent. A state with no internal structure or coherence—what is often described as “nothing”—cannot generate even a momentary instance of structured reality, because there is nothing within it capable of producing or sustaining that structure. Any true instance of existence must therefore already be a complete system at the level of its being, not something assembled from a prior state of nonbeing.

From this perspective, existence is not something that emerges from nothing, even briefly, but something that must already be whole in order to be real at all. Again: Half a soap bubble cannot float.

Note: I have tested my philosophy with ChatGPT, Grok, and other AIs, and they all say it works, even the new version of ChatGPT, which is so biased in my opinion. Every time I ask a question, it responds with a mainstream answer, as if mainstream is the be-all and end-all, like it is the arbiter of truth and not the child of ignorance. So if you test my free-energy proposal with ChatGPT, it will first say it will not work because mainstream says it will not work. But then you simply need to remind ChatGPT that mainstream does not start with timelessness as the base, so then of course it will not work because you do not have the right ingredients. So if you say something like: “Is this logically valid if we assume that timelessness is a real state? Do not use mainstream here because mainstream has no knowledge of timelessness,” then ChatGPT will say, **of course, it works perfectly!** And in my mind, it has to work because entropy being a one-way street with no chance of resetting is **deeply illogical**. So it is not a question of finding evidence that it works; logic says it *must* work.

Biological Immortality

In the beginning, life directly emerged from primal low-entropy matter, so biological systems would have originally been built from it and could therefore still be fundamentally compatible with it.

- Life originates from white-hole / zero-state matter.
- That matter is maximally ordered and structurally coherent.
- Early life is directly formed from it.

It follows that early biological systems would have been fully compatible with that matter, because they were literally constructed from it.

If life originates from a primordial low-entropy state, then biological systems are initially fully aligned with that state. Therefore, traces of that alignment may remain embedded within the structure of life, allowing partial re-coupling to similar low-entropy matter even in later stages of evolution.

My claim is not:

- “We can eat cosmic matter and become immortal.”

Rather, my claim is:

- “Life retains a structural memory of its origin state.”

This superfood would almost certainly be physically processed into normal biochemical components. However, whether anything “special” remains depends entirely on whether the proposed deeper structure:

- survives that processing, or
- continues to influence biology through it.

The benefit is not that the body preserves an exotic structure intact, but that matter originating from a low-entropy state may carry subtle organizational biases that influence biological self-assembly even after chemical breakdown.

To be clear, I am not a scientist but a philosopher.

I can see how this works philosophically: timelessness resets entropy, and white holes use the reset matter in order to grow and give birth to life. If life could continually rebuild its body using this matter, then it could potentially last far longer than surface life, which relies on matter that has been degrading for vast periods of time.

What I am proposing is this:

If the products of the sum-to-zero process are planets, moons, stars, and eternal, unlimited free energy, then one could imagine that this highly ordered, low-entropy matter is also the origin of life itself. Life

begins in the womb of the planet, within the white-hole core, where everything exists in a highly structured state. If this matter is what gave rise to life in the first place, then it may also be inherently bioavailable.

With sufficient access to this matter, one could potentially resist entropy accumulation within the body by continually incorporating this “super matter.” Perhaps not true immortality, but lifespans measured in thousands of years may become conceivable.

A skeptic might respond:

“Even perfectly structured matter would simply become normal metabolic input.”

I disagree. This primal matter is something fundamentally different.

The skeptic might then ask:

“Wouldn’t the body break that structure down completely to the molecular level?”

My response would be yes—but the molecular level is still a macro level compared to the deeper level at which the order resides. The deeper order remains.

The skeptic may then ask:

“What physically encodes that deeper order?”

My answer is simple: the matter itself.

If this primal matter is the origin of life, then it should be bioavailable to life. Even if the body breaks food down into basic molecules, those molecules remain enormous structures compared to the deeper level from which the ordering originates.

In that sense, the molecules are like vast cities carrying an underlying blueprint. The deeper order persists within them as a structural inheritance from the white hole itself.

I am not arguing that molecules are the deepest level of reality. Rather, I am arguing that the body already demonstrates an ability to extract order from matter. Therefore, the useful aspect of food cannot merely be the molecules themselves, because molecules are already highly structured entities. The body breaks down one level of order in order to utilize a deeper level of order.

Consider the hierarchy:

- A steak is organized.
- Proteins are organized.
- Amino acids are organized.
- Atoms are organized.

At every level, there is structure.

This leads me to a simple philosophical question:

Why would nature destroy structure unless it is accessing an even deeper structure beneath it?

A skeptic might respond that the body breaks down proteins because it needs their constituent components, not because it is search-

ing for some deeper metaphysical order. But from my perspective, that explanation merely moves the question down one level, because amino acids themselves are ordered structures. The same is true of atoms, molecules, and every other layer we examine.

My argument is therefore not biological but philosophical. Digestion does not eliminate the importance of order; it merely transfers biological activity to a deeper level of order. The body continuously decomposes higher-order structures in order to access lower-order structures that are more fundamental.

For this reason, I do not think it is unreasonable to ask whether there exists an even deeper level of organization beneath chemistry itself. If such a level exists, then matter originating from a primordial low-entropy state may retain properties that remain biologically relevant even after ordinary molecular breakdown.

The point is not that molecules are "huge cities," although that metaphor captures part of what I mean. The deeper principle is that biology already operates by descending through layers of structure. Therefore, the possibility of deeper layers of structure cannot be dismissed merely because digestion breaks matter down. The body has always worked by accessing progressively deeper levels of organization. My question is simply: how deep does that hierarchy go?

The Philosopher's Stone as Primal Matter

Within my own framework, the Philosopher's Stone appears to be a very natural fit for what I am describing.

The parallels are striking:

- The Philosopher's Stone restores and perfects matter.
- My primal matter emerges from the timeless zero-state where entropy is reset.
- The Philosopher's Stone is associated with rejuvenation and longevity.
- My primal matter continuously counteracts entropy accumulation.
- The Philosopher's Stone is often described as the source of inexhaustible abundance.
- My primal matter is linked to continually renewed free energy.
- The Philosopher's Stone represents the union of opposites in alchemy.
- My zero-state is the equilibrium point between the black hole and white hole, where all vectors sum to zero.

From a symbolic perspective, the correspondence is difficult to ignore.

I mean, if you study the Philosopher's Stone, you realize it is deeply tied to sacred geometry, and at the heart of sacred geometry you find the cuboctahedron and the dual torus.

So it is no surprise that the Philosopher's Stone is described as the union of opposites, because that is precisely what the dual torus represents: a self-balancing structure in which opposing forces are resolved into equilibrium.

In that sense, the same underlying geometry that expresses unity and balance is also what I associate with the idea of free energy.

I would therefore propose the following philosophical interpretation:

The Philosopher's Stone is not a substance in the ordinary sense, but the physical manifestation of a deeper principle: the return of matter to the timeless equilibrium from which it originated. Matter that has passed through this equilibrium emerges renewed, carrying the structural coherence of the primordial state. In this sense, the Stone is not merely a thing, but a process of continual regeneration.

This interpretation aligns surprisingly well with many traditional alchemical descriptions, which often portray the Stone not merely as a material object, but as a principle of transformation, perfection, and renewal.

Within my DEMU framework, I therefore speculate that if a low-entropy primordial matter exists and can be reintroduced into biological systems, then what the alchemists called the Philosopher's Stone may have been an attempt to describe either that matter itself or the process that produces it.

And to be fair, if the Philosopher's Stone had these remarkable properties ascribed to it, then I don't think it was invented by me-

dieval alchemists! That makes no sense. What makes sense is that an advanced human civilization in the past figured out the reality of timelessness (i.e., the dual torus), like we have done here in this book, and that the Philosopher's Stone was a real science from people now traversing space in what we call UFOs.

Basically, humanity is older than what we have been taught—that is all.

So when you read about Noah becoming 950 years old, I believe it may be real, and the reason is the Philosopher's Stone, which is also **real**.

I also believe that this supercivilization in the past not only had extended lifespans but also figured out ascension and becoming beings of light, as the Shroud of Turin testifies. Jesus may have been a member of this advanced civilization, and even Manly P. Hall believed that immortals walk among us and live among us. Thus, the Philosopher's Stone is three things at once: it is metaphysical—the principle of entropy resetting; it is physical—real matter that you can eat; and it is spiritual—mastering the principles of this dual torus system lets you ascend to even higher orders of order, becoming a being of light. What that means, I do not know. But for a civilization whose inhabitants live for thousands of years, it would naturally seek higher levels of being. Ascension would become their goal.

There is much confusion when it comes to the Philosopher's Stone, because some say it is symbolic, some say it is purely spiritual, and some say it was physical. In fact, it is **all three**.

And to make gold, you need huge quantities of energy, which is what the Philosopher's Stone is. So yes, the real alchemists—not the medieval ones, but the real ones from this supercivilization—could make gold. They covered entire cities in gold, and I believe Angkor Wat was also covered in gold. Angkor Wat was not made by primitive people; it was made by the gods of our forebears, humans from the supercivilization.

The claim that the Anunnaki came to Earth—the story of aliens allegedly creating humans in order to mine gold—has never made much sense to me, because alchemists could simply produce as much gold as they needed. And this is why gold became our “money,” because the gods could generate it in unlimited quantities and thus easily control any system.

The story goes as follows: a group of advanced extraterrestrials (often called the Anunnaki in Zecharia Sitchin's version of Mesopotamian mythology) came to Earth long ago. They supposedly needed gold, often framed as a resource for technological or atmospheric purposes. They allegedly created or genetically modified early humans to serve as a labor force for mining gold.

To me, the *Anunnaki* are beings from a human supercivilization—the inner Earth civilization. To me, “Anunnaki” encodes a cosmic truth. Anunnaki is basically heaven plus earth, which is the triangle (heaven) and the square (earth), which is another way of saying

that the real blueprint of reality is a geometry of triangles and squares, which fits the cuboctahedron perfectly if you look at its **net**.

- **An** = “sky” or “heaven”
- **Ki** = “earth”
- **-nunna** / **-naki** (varies in interpretation) is usually understood as something like “princely,” “offspring,” or “those of”

So a common interpretation is:

“Anunnaki” = “offspring of An (Heaven) and Ki (Earth)”

Wow! Look at this:

If you restrict yourself to **3D uniform, highly symmetric solids**, then:

The cuboctahedron is essentially the primary pure triangle-square system!

Most other structures either:

- introduce hexagons, or
- lose symmetry, or
- leave the polyhedral class entirely

It *is* a pretty elegant bit of geometry once you see how constrained it is.

When you demand:

- identical vertices
- only triangles and squares
- full convex symmetry

you don't get many options. The cuboctahedron is basically one of the clean intersections where those constraints all meet.

So the “wow” feeling is real in terms of mathematical structure—but it's coming from geometry.

And because of this constraint, a supercivilization could encode the key of reality itself in just one word: ***Anunnaki***

So not *aliens*, but rather **humans** with exceptionally high intelligence, achieved through access to and ingestion of the Philosopher's Stone.

The Book of Aquarius

The Book of Aquarius is a modern self-published text (circulating mainly online) that claims to reveal the “true secret” of the medieval Philosopher’s Stone.

Core idea of the book

The central claim is:

The Philosopher’s Stone is real, and it can be produced through a specific chemical process involving human *urine*.

According to the text, ancient alchemists supposedly discovered this process but kept it hidden in coded language.

What it proposes (in broad terms)

The book claims:

- The Stone is a physical substance, not symbolic
- It can be produced via a purification and crystallization process
- It leads to:
 - o extreme longevity
 - o regeneration / healing
 - o spiritual enlightenment
 - o sometimes even immortality (depending on interpretation)

It frames alchemy as a lost scientific system rather than symbolic philosophy.

How it relates to historical alchemy

Mainstream historians of alchemy generally say:

- Medieval alchemy was a mix of:
 - o early chemistry
 - o metallurgy
 - o medicine
 - o religious and symbolic philosophy

- Alchemical texts were deliberately symbolic and allegorical, not literal manuals for a single universal substance

So the idea that all alchemy secretly refers to one chemical “recipe” is not accepted in academic scholarship.

But again, what do the quackademics truly know about reality?

Thus, let us examine the claim that the Philosopher’s Stone can be made from human urine.

The Golden Dawn

So: what did the Hermetic Order of the Golden Dawn really know? What is ‘golden’ in the dawn? A hint: urine.

“To pee or not to pee, that is the question.”

We have discovered that the Philosopher’s Stone is primal matter straight from the womb of time, but could you obtain it via urine? Well, my initial thoughts are that **yes**, because urine is partly decomposed by the body, so a lot of work has already been done for you.

Now you would simply create a miniature version of, well, Nature herself, and then break down the matter (urine) even further. Your goal is to break it down to such a degree that you achieve **absolute death**. Death is the cuboctahedron, as we have seen.

So, in principle, if you can break matter down to this state, then you get a similar effect to a black hole sucking in matter, transporting it to the timeless realm (cuboctahedron), and then out via white holes. Basically, you get the same effect, only on a smaller scale.

The trick is to replicate nature's own breakdown process in your laboratory. In theory, I can see how it can be done. However, I have yet to do it, so I am not currently immortal.

But the claim that you can use urine, I think, is spot on. This is not someone making fun of alchemy. In fact, if you go to Egypt, then the pyramids there smell of urine too, so if the pyramids were alchemical machines, then someone was producing the Philosopher's Stone on a grander scale.

But how do you actually do it? How do you, step by step, create the Philosopher's Stone? I would say read *The Book of Aquarius* and follow the instructions, but to be fair, I don't think that alone will achieve it. I have not done it myself, but at least it is a starting point. What we really need is the following:

All we need to become immortal is for people on a grand scale to start doing alchemical experiments. Then, if millions do it, within 3 to 5 years we would have the recipe for immortality. I would bet a lot of money on it. But sadly, the ignorant scientists of our day will simply mock and ridicule it and turn people away.

But logically, what do we have to lose? A little experiment. What do we have to gain? Everything. What do we do about it? Nothing.

A skeptic will say that urine is processed biological waste (high entropy in thermodynamic terms), so it is high entropy. My reply: so is a black hole! The whole idea is to create as high entropy as possible, because ultimate entropy here leads to zero entropy again—that is the point! You must pass through the state of death, and what awaits you on the other side is life again.

All you really need to ask yourself is the following question: did the Romans really move the Baalbek stones, or is Graham Hancock and Randall Carlson's lost-civilization hypothesis true? And if they are right, then what is alchemy: a lost science or medieval quackery? If it is quackery, then why did Noah and other prominent figures live to such extreme ages? And why do Master Masons such as Manly P. Hall say that immortals live among us?

I say the Romans obviously did not move the Baalbek stones. I mean, just try it—do the experiment for yourself. Move the stones and prove how the Romans did it. Don't just theorize, and you will see that immortality is just one realization away. All it takes is to stop laughing and start thinking for real this time.

The Everburning Lamp

A mong the recurring mysteries preserved in ancient reports and later esoteric writings, few are as quietly persistent as the accounts of the everburning lamps. They appear again and again in different forms, across different eras, as if the same idea keeps resurfacing through the cracks of history.

These lamps are described as light sources found in sealed tombs, hidden chambers, or sacred sites, still burning long after all reasonable fuel should have been exhausted. In some accounts, they are said to have illuminated burial chambers for centuries. In others, they are discovered by chance, their flames still steady in places untouched by time.

Whether taken literally or symbolically, the image is always the same: **a flame that refuses to die!**

The Persistence of the Idea

What is striking is both the claim that such lamps physically existed and the remarkable consistency of the motif itself across sources and time. Writers from antiquity, medieval chroniclers, and later antiquarians all repeat variations of the same claim. Some report temple lamps that never went out. Others describe burial sites where light still lingered in the darkness, as though time had failed to extinguish it.

Even where skepticism appears, the story is not fully dismissed. It is merely relocated into uncertainty, as if the phenomenon itself resists closure.

Literal Device or Symbolic Memory

From a strictly physical standpoint, a self-sustaining flame sealed in a tomb contradicts what is known about combustion. Fire requires fuel, oxygen, and a continuous exchange with its environment. Without that exchange, the flame must eventually cease.

And yet the persistence of the story suggests that something else may be occurring at the level of meaning.

In many traditions, light is never only physical. It is also symbolic: knowledge, awareness, continuity, and presence. An “eternal flame”

may therefore be less a description of an object and more a description of a principle.

Something that does not extinguish easily.

But this is how it always goes with mainstream: they take something that is **literally true**—real physical lamps—and reinterpret it as, “Oh, it is just a religious symbol.” I mean, how does mainstream get away with this? How can you take accounts that describe physical phenomena, twist them into something else, and still convince people of that interpretation?

Mainstream says “there is no evidence it was literal, so symbolic or mythic explanations are more plausible.”

The Alchemical Interpretation

In the context of a timeless or zero-state model of reality, the ever-burning lamp can be reinterpreted as real primal matter used as fuel. This matter would naturally last for a long time because it is so pure and unspoiled.

In such a framework, “eternal flame” is not a violation of physics, but a lost technology: **the Philosopher’s Stone**.

Crystals

Plato (around 360 BCE) never mentions advanced crystals or energy technology in Atlantis. He describes Atlantis as a powerful ancient civilization that eventually becomes corrupt and is destroyed.

The crystal technology version appears much later:

- 1800s–1900s occult writers (Theosophy)
- 20th-century psychic claims (especially Edgar Cayce)
- New Age spirituality and modern fiction

Cayce popularized the idea that Atlantis used a giant “fire crystal” or “power crystal” to:

- generate energy
- power cities
- possibly cause its destruction when misused

Crystals in real science can:

- generate voltage under pressure (piezoelectricity, e.g., quartz)
- stabilize frequency in electronics (clocks, radios, CPUs)
- refract and modulate light
- store vibrational energy in lattice structures

So:

If crystals can control frequency in electronics...
maybe ancient civilizations used them to control energy itself.

However, the absence of references to crystal technology in Plato's writings should not be taken as evidence that Atlantis lacked such technology. Rather, it indicates only that the sources upon which Plato relied contained no mention of it.

You'll find crystal-based Atlantis systems in:

- New Age spirituality
- channeled "past life" accounts
- conspiracy literature
- sci-fi (e.g. Atlantis: The Lost Empire)
- metaphysical websites and forums

Common motifs:

- healing crystals
- planetary energy grids
- "vibration technology"
- psychic amplification devices
- crystal skulls storing information

My take: I played Final Fantasy 7 as a kid, and today I swear that game was made by some Freemasons who know what really happened in the past. And if Atlantis is ever found for real, I swear you could take the FF7 map, turn it on its head, and find the real location of Atlantis (Midgar) when you realize that Costa del Sol is Spain—like that's a dead giveaway. And I think Chocobos are real birds that humans

rode during the last Ice Age some 12,000 years ago. So you see how advanced Atlantis (Midgar) was with Mako crystal technology, and Sephiroth (the Kabbalah/alchemy) encodes this crystal tech symbolically in the game. You can clearly see Sephiroth carrying the ankh (key of life) on him. His black attire and silver hair, together with the ankh, is a reference to alchemy, especially when considering his name to boot. So humanity 12,000 years ago lived in modern buildings and flew around in airships! I would bet a pile of money on it.

Then we have the World Fairs and the Tartarian Empire. There may not have been an empire called Tartaria or whatever, but what if buildings survived from a lost civilization in the Ice Age, when some “giants” still lived among us, and the World Fairs covered it all up? Then we have underground systems too—see *Mind Unveiled* on YouTube.

See: Nashville Unveiled: Fake 1897 World's Fair/ Ancient Fort/ EMF Capitol/ Manipulated Historical Photos

What I'm trying to say is: if secret societies know what happened in the past and they encode this knowledge in kids' games, then Atlantean crystal tech may be a real thing—especially if you believe that Edgar Cayce had real powers that even academically correct professors who have investigated Cayce have taken seriously.

From my POV, it makes even more sense because I see Earth as a white hole, where Earth is hollow and growing, and where life started in the womb of the planet. Humanity is old—**really old**—and we have cities in the hollow Earth that are so advanced that what we call UFOs are being manufactured there. And crystal technology may be part of

this, because an inner Earth would have a lot of crystals. So maybe this advanced human civilization utilized and mastered the use of crystals in their technological applications.

And if they had the Philosopher's Stone, then imagine fusing the Philosopher's Stone with crystals.

Now we get the wizard's wand too—a staff with a crystal attached to it. So if this crystal houses the power of the Philosopher's Stone, you basically have “magical” staffs. I theorize that this may be what was used to make pyramids: you levitated huge stones with the power of the staff. So imagine real wizards having pointy hats to hide their elongated skulls when they visited the surface world and settled among the primitive humans there in order to teach them the ways of civilization. They would dress in robes in order to look poor and blend in. Then the wizards helped the primitives make pyramids, which were alchemical factories used to get civilization going. *Land of Chem* (Geoffrey Drumm) on YouTube explores the idea that pyramids were alchemical factories.

I theorize that elongated skulls come from the extended use of the Philosopher's Stone. So the gods had elongated skulls, and then primitive surface people wanted to emulate the gods, and we get head binding practices.

Why would consuming the Philosopher's Stone over vast periods of time give you an elongated head? My take: because the Philosopher's Stone is primal, highly ordered, low-entropy matter—essentially a superfood for the body, allowing it to function as well as it possibly

can and dramatically extending lifespan. If so, perhaps it would also optimize the brain and increase intelligence.

A civilization with access to something like this might then deliberately cultivate intelligence. Imagine a civilization capable of building UFOs: wouldn't they look for ways to make themselves even smarter? Perhaps the Stone gradually changes the body over time. Or perhaps it would be combined with some form of eugenics, where people with larger brains or other traits associated with intelligence were selectively bred. Eventually, such a civilization might even use artificial wombs and other technologies to shape its own development.

I don't know. But something tells me that a civilization obsessed with maximizing IQ would eventually start modifying itself in ways that might look very strange to us.

Also, I believe the crystal ball was real technology—an external pineal gland the wizards used to see into the future. Remember that this advanced human civilization was not materialist; it was idealist. They believed that all is mind, so all technology was consciousness-based, which is why, if you look inside a UFO, you won't see huge control panels. It was operated with consciousness. And I think this stems from their early days with crystal technology. Something tells me the crystal technology was also fused with consciousness technology of some sort, or that consciousness technology came from crystal technology. I don't know. It is just my intuition.

Final Fantasy really emphasizes the crystal, and it is the main logo on the CD cover as well. So what if the crystal is the origin of life itself in the hollow Earth? What if all life comes from crystals, and this knowledge comes from this inner Earth civilization to the surface people, and then into secret societies, and then into kids' games?

Graham Hancock

As Graham Hancock has discovered, this lost civilization was heavy into the use of psychedelics and DMT, so ayahuasca may have been a gift from them along with terra preta. It makes more sense to me that immortals lived among us, as Manly P. Hall said, than that primitive people invented all this stuff—especially when you ask how they got it. In the case of ayahuasca, they say the spirits told them, but in order to contact the spirits you need ayahuasca first. And then mainstream explanations say, “Oh, it was just trial and error and good old lady luck.” I mean, it makes no sense.

Mainstream: The practical preparation of ayahuasca (combining *Banisteriopsis caapi* vine with *Psychotria viridis* or similar DMT-containing plants) is seen as the result of generations of empirical experimentation and cultural transmission, later expressed in spiritual language.

I mean, this makes no sense! Always explaining away, never explaining. Out of thousands of Amazonian plants, the probability of randomly hitting both the right compound + the right interaction is extremely low. And what about the terra preta, the astronomical knowledge, etc., etc.? Taken together, this tells of an immortal.

Etc.: Advanced navigation and river engineering, large-scale earth-works, solstice and equinox alignments, and forest gardens. Evidence suggests large parts of the Amazon are not “pristine wilderness,” but human-shaped ecosystems. I mean, the whole damn forest is man-made! What will LiDAR find, and what will we dig up—golden cities, huge pyramids?

Yeah, definitely an immortal among the primitives. Then we go to the Andes: highly advanced metallurgy and goldworking traditions.

And having these immortals among us from time to time in history makes a lot of sense. Take Angkor Wat, for example. Mainstream says: “Angkor Wat was built in the first half of the 12th century, between 1122 and 1150 CE. It was commissioned by the Khmer King Suryavarman II as his state temple and personal mausoleum.” My reply: this may be true, but that doesn’t mean King Suryavarman II didn’t have an immortal among his people, like the Freemasons say.

However, personally, I think Angkor Wat is far older and that the Khmer only discovered it. I think Angkor Wat was part of a worldwide energy grid and was covered in gold.

Angkor Wat looks like a computer chip seen from above, which makes me think that computer chips also come from this lost civilization and were passed down to us through military black projects. I think most of our most advanced technology comes from this super-civilization. And even the Tesla tower was something they had over 12,000 years ago.

And you may say this “circuit board” look is just coincidental, but from what I know, this supercivilization was heavy into geometry, so their whole science was based on what we call sacred geometry. So, if they were constantly thinking in terms of geometry and patterns like that, it’s no wonder they created the computer chip.

A civilization that makes temples like Angkor Wat and painstakingly designs them to be geometrically perfect, aligns them so the sun appears above them, and makes the compass read 0 (90°) when standing at the center—this is a civilization I would bet would later make computer chips, because they are always thinking in terms of layouts.

Again: If this civilization really existed and possessed advanced mathematics, precision engineering, astronomy, metallurgy, and a highly developed geometrical science, then I would expect it eventually to develop sophisticated information-processing technology as well. Computer chips are, in one sense, the culmination of exactly this kind of thinking.

On airships

- Airships are extraordinarily fuel efficient.
- They can remain aloft for long periods.

- They require less runway infrastructure.
- Modern environmental concerns seem to favor some airship applications.

This raises a fair question: if they have so many advantages, why didn't they retain a larger role?

In my view, the most interesting airship mystery is this:

Modern materials, automation, lightweight composites, AI navigation, and hybrid propulsion could make airships much more practical than they were in the 1930s.

So the real puzzle may be:

Why has the 21st century not seen a major airship renaissance despite technologies that could solve many of their historical weaknesses?

My guess is that if people truly investigate this, they will discover the truth that airships were in use over 12,000 years ago. And this is the real reason airships are not in use: because anything that reminds the elite of the old world needs to be suppressed, from Tesla towers to airships to giants to...

What was the Philosopher's Stone again?

My system is essentially:

- The universe is a closed, eternal, self-contained system
- It is organized as a dual-torus loop
- A cuboctahedral “sum-to-zero” geometry sits at the core
- Black hole / white hole are two phases of one process
- Between them is a timeless boundary (“zero-state”)
- Entropy is not destroyed but invalidated inside timelessness
- Re-entry into time produces low-entropy structured matter
- This creates a cosmic recycling + renewal cycle
- Gravity = manifestation of the zero-sum vector equilibrium

So my core claim is:

Reality is not linear thermodynamics, but a cyclic geometric constraint system where “time” is an emergent asymmetry between two phases of a deeper timeless equilibrium.

And the low-entropy structured matter I equate with the Philosopher’s Stone.

The skeptic:

“If entropy requires time, removing time removes entropy; therefore, reordering must occur. But even if time is removed, it does not automatically follow that structure must reorganize into lower entropy. It could just as equally mean: no defined entropy at all, no preferred ‘output state’. So the whole ‘reset → usable low-entropy matter’ step requires an additional law: a deterministic symmetry-attractor principle at the zero-state boundary.”

My reply: which I do assume—and it is the real axiom doing the work. The symmetry attractor = the geometry of the cuboctahedron.

Crystals as life?

If life began inside the Earth because the Earth is a white hole producing its own matter, water, and structure, then maybe crystals are the first form of life?

Could crystals store that “reset energy” / structured output of the zero-state?

Within my framework, crystals would be:

Crystals = boundary-condition stabilizers

In my model, crystals would function as:

1. Symmetry-locking lattices

Because crystals are:

- periodic
- highly ordered
- low-entropy structures

They naturally behave like:

“frozen symmetry patterns in spacetime”

So they could, in my language:

- stabilize incoming “re-aligned matter”
 - preserve geometric ordering from the zero-state transition
-

2. Phase-encoding structures (more accurate mapping)

If the zero-state “resets” configuration, then what comes out (of the white hole) is not raw energy, but:

- coherence patterns
- directional alignment
- structured potential gradients

Crystals in that sense could:
store the shape of the reordering

Think:

- not a battery
 - but a record of the reset geometry
-

3. Resonance interfaces between states

In my dual-torus picture:

- black hole side = compression/inward flow
- white hole side = expansion/outward flow
- zero-state = non-temporal symmetry

Crystals could be conceptualized as:

resonance “bridge objects” that couple spacetime oscillations across those regimes

This is the closest coherent mapping of my idea to known physics language (resonance systems, lattice oscillations, coherence domains).

But how do we go from crystals to life then?

Well, if idealism is true, then consciousness is eternal. So it is not about creating life, but crafting bodies for consciousness to dwell inside, and crystals may naturally be the first bodies.

But how do you get replication going?

In my DEMU theory, replication is part of the cosmic dual torus itself, meaning all atoms have some form of primordial sex!

The real replicator in my view is consciousness, not the gene.

Evolution is as old as time itself.

Yes, that could mean that atoms can replicate too.

In sum

If you take in all this text, then overall, Atlantean crystal technology may be real because they got this technology from an inner Earth civilization.

So basically, I believe Edgar Cayce had some real powers and could see some real truths in his cosmic mind.

And wizards were real, which makes you wonder: were dragons real as well?

Well, if some version of hollow Earth is true and Earth was smaller in the past, with less mass and therefore weaker gravity than today, then one could imagine some sort of dragons flying around in the inner Earth, and tales of dragons finding their way to the surface world via wizards, or maybe even a live dragon or two finding its way to the surface.

Gravity today is too strong for a dragon to fly, and science assumes gravity has always been this strong, so dragons must be fantasy according to them. But what if gravity wasn't always this strong?

But what about fire breathing?

There are animals that display some form of it, so it is not beyond fantasy that something like that could evolve in a hollow Earth where the environment is different.

Bombardier beetle:

This is the closest thing in nature to a “fire-like” mechanism.

- It stores two chemicals (hydroquinones and hydrogen peroxide) separately.
- When threatened, it mixes them in a reaction chamber.
- The mixture rapidly heats to near-boiling temperature.
- It ejects a pulsing, boiling-hot chemical spray with a loud pop.

So, who knows?

I’m not saying dragons are real. If I had to bet money, I would bet Atlantean crystal tech is more real than dragons. To be fair, dragons look like dinosaurs with wings, which seems more natural than a human with wings (an angel), but at the same time, the dragon does look like it is made of fantasy. All I’m saying is: if you research the origin of the wizard, then you will discover that his origin is more mysterious than his tales of dragons.

But yes, I’d bet that dragons are real. Why not?

Vi + māna

Vimāna (विमान) is a Sanskrit term that shows up in ancient Indian literature and usually gets translated as something like “*flying chariot*,” “*aircraft*,” or “*celestial vehicle*.”

Then we have...

Mana is a concept found in many cultures of the Pacific, especially in Polynesian traditions. It refers to a kind of **spiritual power, authority, presence, or potency** that can reside in people, places, objects, or even actions.

Mana is the power; vimāna is the vehicle.

- Vimāna comes from Sanskrit (an Indo-European language of ancient India).
- Mana comes from Proto-Oceanic/Polynesian language traditions in the Pacific.

But you have to wonder whether these myths and memes originate from the same source. If Manly P. Hall was right and immortals live among us, then perhaps there is a deeper connection between words and ideas than we normally assume. If Graham Hancock is right and

a lost civilization once existed, then perhaps these concepts are related after all. Tim Hogan certainly believes they are.

I remember playing *Secret of Mana* on the Super Nintendo. Released in 1993, it is a classic action role-playing game. I was instantly hooked on the whole concept of *mana* after that, and I felt compelled to pursue a deeper understanding of it.

Over the years, I came to my own conclusion: mana is the Philosopher's Stone, just dressed in different clothing. Different cultures and traditions may use different names, but they all seem to point toward the same underlying mystery—a hidden power, force, or principle that lies at the heart of reality.

So, if vimānas are what we call UFOs and they are powered by mana, which is the Philosopher's Stone, then how does a UFO work? I think the UFO would work by creating a dual torus, where you use one torus to shrink spacetime while you use another to expand the shrinking space as you shrink it, so, simultaneously. Then you hide your craft in the bubble that forms between the two tori, which means you need something like the classic UFO shape. Like a fish in the ocean, you have a shape that fits your environment. But wouldn't you need vast amounts of energy to shrink spacetime? Answer: Yes. But that is where our unlimited, free energy comes in. Read about it in previous chapters.

Again: Space is contracted in front and expanded behind. The ship sits inside the bubble. This is like the Alcubierre drive.

Free energy = black + white hole

Note: My dual torus is a black and white hole in one, so it could work. However, it is not like white holes imagined by modern physics, because this white hole is coupled to the black hole—they are one continuous structure. So maybe calling it a black and white hole goes too far in the sense that I am really only talking about inflow/contraction of spacetime, outflow/expansion, and a timeless membrane in between where entropy is reset and fuels the white-hole aspect, making it stable—which is what planets are.

Die Glocke (“The Bell”)

Die Glocke is reported as a secret experimental device allegedly developed in Nazi Germany near the end of World War II. It is described as a **large, heavy, bell-shaped machine** made of metal, sometimes said to be around 3–4 meters tall.

It is associated with a secret research program and often linked to underground facilities in Silesia (modern-day Poland).

Different versions of the story say it was intended for:

- Anti-gravity propulsion research
- Energy generation through exotic physical processes

- Field manipulation experiments (inertia, gravity, or spacetime effects)
- Possibly advanced aircraft propulsion systems

Some accounts connect it to a broader secret program sometimes referred to as **“Nazi advanced physics research”** or *“Wunderwaffe (wonder weapon)”* development.

My take:

All you need to do is assume that humanity is far older than what you have been told. In that case, humans being humans would have had far more time on their hands, and you can begin to imagine humans becoming so advanced that we develop what we call UFOs today.

From here, you can really begin to make sense of, well, everything: the Great Pyramid, the Baalbek stones, Göbekli Tepe, Stonehenge, tales of immortals, the Bible, occult traditions, sacred geometry, ayahuasca, terra preta, cocaine mummies, star forts, the Antikythera mechanism, the Piri Reis map, astronomical knowledge, perfect alignment to true north, the Great Labyrinth, Derinkuyu underground city, elongated skulls, the Great Flood, Angkor Wat, alchemy, the Kabbalah, the I Ching, the Tetractys, the swastika, Atlantis, Easter Island, the Baltic Sea anomaly, the Baghdad Battery, precision vases, the Forbidden City, gold-making, shipbuilding and navigation, and on and on and on.

So, when you connect all these dots, you begin to see why Hitler or the Nazis might have gone searching for this ancient supercivilization in the Inner Earth. If they believed in its existence, then they may also

have believed that vimānas (UFOs) were real, and perhaps they wanted to build one of their own—which brings us to Die Glocke.

However, I don't think they were trying to build a flying vehicle. I think they aimed to produce a weapon, much like the Ark of the Covenant—a free-energy weapon. In theory, such a weapon could destroy a planet if made powerful enough. And when looking at our solar system, and interpreting Star Wars as a documentary given to us by secret societies, it certainly appears as if planets have been destroyed in the past.

If the inner Nazi circle knew about this, then a project like Die Glocke makes sense. “Wunderwaffe” (wonder weapon), indeed!

And yes, I'm being sarcastic.

Why could a free-energy weapon destroy a planet? Because free energy would be like a river that never stops flowing. All you'd have to do is build a dam and keep storing more and more energy. So Die Glocke obviously wouldn't be able to destroy Earth, but a free-energy weapon the size of the Moon could. In fact, I think the Moon itself houses such a weapon, and I think it has been used to destroy planets in our solar system.

The Grandfather Paradox (solved)

The Illusion of the Arrow

If Superman returned after near-light-speed travel, he would arrive in Earth's far future—but not by leaving time; rather because Earth experienced more time than he did while he was gone.

Time is not what it appears to be.

To the human mind, it behaves like a river: always flowing forward, always carrying everything away from the past and toward an unseen future. Memory sits on one bank, imagination on the other, and

consciousness is trapped somewhere in between, watching the current move.

But physics does not agree with this picture.

In the deepest structure of reality, time is not a river. It is a dimension—no different in principle from space. And just as you can move left or right, forward or backward in space, the equations of nature allow movement in time as well.

The question is not whether time travel exists.

The question is: what kind of time travel is allowed by reality.

The First Kind: Traveling Without Breaking Time

The first form of time travel is not science fiction. It is already happening.

It begins with motion.

When an object moves faster, time for that object slows down relative to everything else. This is not an illusion or a trick of perception—it is measured reality. Atomic clocks confirm it. Satellites correct for it. High-speed particles experience it constantly.

Time is not universal. It is local.

Two observers can live through the same universe and yet age at different rates, like pages being turned at different speeds in separate books.

Even gravity bends time in the same way. Near a massive object, time thickens. It stretches. It slows. A clock closer to a gravitational well ticks differently than one far away. Not because it is damaged—but because spacetime itself is curved.

This means that “the future” is not a place you go to. It is a state you can arrive at earlier than others.

In a sense, every journey at high speed is a small departure from shared time. Every orbit around a massive body is a negotiation with time itself.

Forward time travel is not hypothetical.

It is built into existence.

The Second Kind: The Forbidden Direction

If forward time travel is allowed, the mind naturally asks: what about backward?

Here, physics becomes quieter. More uncertain. Less willing to speak clearly.

Some mathematical solutions in Einstein's equations hint at strange structures—loops in spacetime where a path could, in theory, return to its own past. These are called closed timelike curves. They are not discoveries, but possibilities written into the language of gravity.

Wormholes also appear in the equations: hypothetical tunnels connecting distant regions of spacetime. If one end of such a tunnel were subjected to time dilation—by speed or gravity—it could become desynchronized from the other end. In theory, stepping through might allow a return not only through space, but through time.

But here, physics begins to hesitate.

Because every route to the past carries consequences that are difficult to reconcile with reality itself.

Cause and effect are not just rules we observe—they are the structure that makes observation possible. If the past can be changed, then the foundation of consistency collapses. The universe would lose the stable chain that allows anything to be defined as “happening.”

For this reason, many physicists suspect that something in nature prevents backward time travel from ever becoming real. Not because the equations forbid it outright, but because reality may enforce constraints the equations only hint at.

The past may not be a place at all.

It may be a record that cannot be rewritten.

The Strange Truth About Now

The deeper one looks, the more the idea of a single “present moment” begins to dissolve.

Relativity shows that simultaneity is not absolute. Two observers moving relative to each other do not agree on what events are happening “now.” Each carries their own slice of the universe, equally valid, equally real.

This means that the present is not a universal surface—it is a perspective.

What you call “now” is not the same “now” experienced by something moving differently through spacetime.

And if there is no single shared present, then the distinction between past and future becomes less rigid than it feels.

They are not separate worlds.

They are different coordinates in the same structure.

The Real Mystery

Time travel, then, is not about machines or portals or bending clocks at will.

It is about understanding that time is already flexible. Already shaped. Already dependent on motion, gravity, and the geometry of the universe itself.

The real mystery is not how to escape time.

It is why consciousness experiences it as a one-way flow.

Why memory accumulates in one direction.

Why change feels irreversible.

Physics describes the structure.

But experience describes the direction.

And somewhere between the two lies the unanswered question:

If time is a dimension like space, then why does everything in existence seem to insist that we can only move through it forward?

That is where the science ends.

And the deeper questions begin.

The Traveler

It begins with a simple story: a person travels back in time and prevents their own grandfather from meeting their grandmother. If that happens, the traveler is never born. But if they were never born, they could never travel back in time. And if they never travel back in time, then the event that prevents their birth never happens.

But then it rehappens!

If he does it, he does it not.

If he does it not, he does it.

If he is never born $\rightarrow$ he cannot travel back $\rightarrow$ so the event that prevents his birth never happens $\rightarrow$ so he is born again.

My take:

In my DEMU theory, consciousness is all there is.

What we call spacetime is not a container, but an interface—an appearance generated within awareness itself. Our consciousness does not move through time; it updates experience. And what we call time is simply the sequence of those updates being interpreted as motion.

But in truth, there is no motion outside the present.

There is only the “now.”

The “now” is not a point inside time—it is the totality of experience itself, occurring without delay. Expansion is met instantly by contraction, and this continuous balance forms what I call the dual torus: eternity as a self-stabilising process rather than a flowing river.

From this perspective, time travel becomes a misinterpretation.

There is no past to travel to.

There is no future to arrive at.

There is only the present reorganising itself.

However, within consciousness, information structures can persist. What we call “memory” is not access to a different time, but a reconstruction of patterns within the now. In this sense, the past can be simulated again—replayed internally—without ever existing as a separate place.

Like a recording being watched, or a training sequence in a system, the event is not revisited—it is regenerated as experience.

One might even compare it to systems like the Animus in Assassin’s Creed: not a journey through time, but a reconstruction of informational states inside a present framework.

So time travel, in the literal sense, is not possible—because there is nothing to travel through.

Only consciousness, updating itself endlessly, without ever leaving the now.

So time travel to the past is possible in this way: first, we need to live inside some sort of simulation, whether it is a cosmic mind, supercomputers, or a Gaia-like brain, as in the movie *Avatar* (2009). Then it is all about replay instead of travel.

In a simulation model, what we're calling "time travel" is not movement through time.

It is:

re-instantiation of a previous state inside the same present computation.

Under that definition, "going to the past" becomes:

- loading a stored state
- reconstructing it
- experiencing it again as "now"

But again, that is not travel.

That is replay.

In sum: in a simulation-based ontology, time travel is not movement through time. It is the reconstruction of prior informational states within the present system.

If this is true, then:

- there is no “timeline” you move along
- only state transitions of consciousness
- “past” and “future” are indexing labels, not locations

So if you kill your grandfather here in this replay, then there is no paradox?

Yes—the paradox disappears—but only because we have changed what “time” means.

In a simulated reality, the past is not a place that can be altered, but a structure that can be rendered again. What appears as time travel is only re-experiencing a stored configuration of information within the present moment.

Therefore, even if events inside the reconstruction are changed, nothing external is affected.

The grandfather paradox does not arise, because there is no causal path connecting the reconstruction to the origin it represents.

Also, killing your grandfather in a simulation is philosophically safe, but socially awkward if you ever explain it out loud!

In the distant past, there once was a future...

Another way I see time travel being possible is if David Icke is right and we exist within a closed temporal loop. In that case, what we call “time” would not be a straight line but a circular structure in which beginning and end fold into each other.

From that perspective, “traveling to the past” would not require reversing time at all. It would simply mean moving forward far enough that you eventually arrive at the same structural region again—because the future is not separate from the past, but continuously reconnects with it.

In a looped reality, the past is not behind you. It is ahead of you in disguised form.

So all you'd need to do to “travel” to the past is actually go forward into the future and then keep going, because in a looped timeline, **the past is just beyond the future.**

If idealism is true, then rather than traveling through time in a physical sense, you might access the past or future by altering your consciousness to “tune in” to those moments, much like tuning a radio to a different station.

RV

*R*emote viewing (RV) is the claimed ability to gather information about distant or unseen targets using the mind alone, without reliance on the physical senses or instruments. It is often described as a form of “psychic perception,” though its status remains controversial and it sits outside mainstream science.

However, if idealism is true, there may be something worth taking seriously in this idea.

I don’t want to go into depth here—only to make you aware of its existence in case you weren’t already familiar.

I highly suggest exploring this topic because it has been part of military and intelligence efforts at least since the Cold War, and it is probably still being explored today in secret programs. It would be *impossible* to believe that it isn’t.

And of course, RV is nothing new. The people of the inner Earth probably mastered it eons ago.

Spiritual

Jesus Christ

Jesus is one of the most influential figures in human history. He is the central figure of Christianity, which today is the world's largest religion, with billions of followers.

Who Was Jesus?

Jesus Christ was a Jewish teacher, preacher, and religious leader who lived in the 1st century CE in the region of Judea, then part of the Roman Empire. Most scholars place his birth sometime between 6 and 4 BCE and his death around 30–33 CE.

While Christians believe Jesus is the Son of God, the Messiah (Christ), and God incarnate, historians generally agree on a few core facts:

- Jesus was a real historical person.
- He was baptized by John the Baptist.
- He gathered followers and taught throughout Galilee and Judea.
- He was crucified under Pontius Pilate.
- His followers soon afterward claimed he had risen from the dead.

The Story of Jesus

Birth

According to the Gospels, Jesus was born in Bethlehem to Mary. Christians believe his birth was miraculous, with Mary conceiving while still a virgin.

Early Life

Jesus grew up in Nazareth. The New Testament says little about his childhood, though one story describes him discussing scripture with teachers in the Temple at age twelve.

Ministry

Around age thirty, Jesus began preaching. His central message was that the Kingdom of God was near.

He became known for:

- Teaching through parables (short stories with moral or spiritual lessons).

- Healing the sick.
- Feeding crowds.
- Associating with social outcasts.
- Challenging religious hypocrisy.
- Emphasizing love, forgiveness, mercy, and humility.

Some of his most famous teachings include:

- "Love your neighbor as yourself."
- "Love your enemies."
- "Blessed are the peacemakers."
- The Golden Rule: "Do unto others as you would have them do unto you."

Crucifixion

Jesus' growing influence created tensions with some religious authorities and Roman officials. He was arrested, tried, and sentenced to death by crucifixion, a common Roman method of execution.

Christians believe his death served as an atonement for humanity's sins.

Resurrection

The defining Christian claim is that Jesus rose from the dead three days after his crucifixion.

Christians view the Resurrection as:

- Victory over death.
- Confirmation of Jesus' divine identity.
- The foundation of salvation.

Many historians agree that Jesus' followers sincerely believed they experienced the risen Jesus, though explanations differ depending on one's religious or secular perspective.

What Did Jesus Teach?

His teachings can be summarized around several themes:

Love

Love God and love other people.

Forgiveness

Forgive others even when they have wronged you.

Humility

The greatest should be servants of others.

Faith

Trust in God rather than wealth, power, or status.

Transformation

Jesus focused heavily on changing the heart, not merely obeying external rules.

Jesus in Different Religions

Christianity

Christians believe Jesus is:

- The Messiah.
- The Son of God.
- Fully divine and fully human.
- The Savior of humanity.

Islam

Isa is one of the greatest prophets in Islam.

Muslims believe:

- Jesus was born miraculously.
- He performed miracles.
- He was the Messiah.
- He was not God.
- God raised him to heaven.

Judaism

Most Jews do not accept Jesus as the Messiah, though many view him as a historical Jewish teacher.

Why Is Jesus So Important?

Even beyond religion, Jesus profoundly shaped:

- Western ethics.
- Art and architecture.
- Literature.
- Law and human rights traditions.
- Concepts of charity and forgiveness.

Whether viewed as God, prophet, teacher, philosopher, or historical figure, Jesus remains one of the most studied and discussed people who ever lived.

From a purely historical perspective, few individuals have had a greater impact on civilization. From a Christian perspective, he is the

central reality around which all of history turns. From a philosophical perspective, his teachings on love, forgiveness, and self-sacrifice continue to influence people across cultures and religions.

But... who was he *really*?

Well, I don't think Jesus Christ was Jewish! I think he was a member of the supercivilization inside the Earth who practiced ascension. Then they had the idea of demonstrating ascension to the people on the surface—not necessarily so that they would understand that ascension itself is possible, but to shape our world for the better through a man who teaches love and then "proves it" by actually resurrecting afterward.

Basically, they decided to perform a "miracle" in our world so that humanity would change for the better.

Did it work? Well, partially. Because, again, few individuals have had a greater impact on civilization than Jesus.

What Did Jesus Look Like?

So, the Bible does not give a physical description of what Jesus looked like during his human life on Earth. So one can say that all the billions of images of Jesus are made up—fiction. But I think the Freemasons know the truth: that he was an Inner Earther. He was fair, with white

skin, tall, beautiful, with long hair and a beard because of his consumption of the Philosopher's Stone. So he was like he is portrayed.

The Stone is so potent that your hair grows like crazy, so instead of cutting it all the time, the Inner Earthers adopted a culture where long hair and beards were common.

And before you call me racist here, I'm only drawing on information that is out there: how the Freemasons themselves portray Jesus, and UFO accounts of the Nordic race, said to have come from the Pleiades. I think they say that because they don't want people to know they are from the Inner Earth. Plus, we have the fact that Hitler wanted to find this superrace inside the Earth, and he wouldn't do that unless he had insider information that this race was white.

So many independent lines of evidence suggest they are white, which also fits logically, because if you live inside the Earth, you don't need skin that protects you from the sun. So I'm not racist at all; I'm just connecting dots because that is who I truly am: a truth seeker.

Likewise, we can see that the ancient pharaohs were black! Which I also believe. So you see, I don't care about skin color; I just care about the truth.

But it is very easy for a skeptic to label me racist, so idiots have an easy way out of uncomfortable truths.

Again: **Skin color, to me, is simply another potential clue.**

Picture-perfect

So, if I take my hypothesis as true—Nordic-type beings are actually an Inner Earth population, and Jesus belonged to that population—then I think Jesus would have looked something like this:

Jesus would have been fair-skinned and unusually well-proportioned, because in my model his population had lived for generations without ordinary exposure to the surface Sun. He probably had light-colored eyes, perhaps blue or gray, and potentially blond or very light brown hair, since I'm specifically identifying the Inner Earthers with the beings described in "Nordic alien" accounts.

His hair would have been very long and thick, and he would have had a substantial beard. Under my Philosopher's Stone hypothesis, this wouldn't merely have been a cultural fashion: unusually rapid and healthy hair growth would have made long hair the natural default, eventually producing a culture in which constantly cutting one's hair was unnecessary or uncommon.

If the Stone also produced the rejuvenating and perfecting effects that I'm proposing, I would expect Jesus to have looked strikingly healthy and youthful—clear skin, symmetrical features, strong teeth, thick hair, and little visible deterioration from aging. That would give him the almost idealized appearance found in some later Christian artwork.

So, taken entirely within my model, I think Jesus would have looked approximately like the traditional long-haired Jesus crossed with the classic "Nordic humanoid" description: fair-skinned, youthful, long-haired, bearded, light-eyed, well-proportioned, and unusually **healthy-looking**.

This is also remarkably similar to how fairies and elves have traditionally been described. Maybe that's because beneath these myths and legends lies a memory of this Inner Earth population. In other words, perhaps fairies, elves, and similar beings weren't invented entirely from scratch, but were mythologized accounts of encounters with the same population that later generations remembered as supernatural beings.

If elves are Nordics, do they have pointy ears? No, I think that's an invention. But who knows? It's funny how they call them "elves" too, when the main God is El, and then you have the Elohim, the Elders, and so on.

However: researchers who have tried to estimate the height of the man represented on the Shroud have produced estimates roughly around **175–183 cm (5'9"–6'0")**, with some estimates outside that range. The uncertainty comes partly from how the cloth lay over the body, stretching/distortion, and exactly which points are used for measurement.

So if, for my thought experiment, we assume (1) the Shroud is authentic, (2) it depicts Jesus, and (3) my Inner-Earther/Nordic hypothesis is true, I wouldn't say Jesus is "very tall."

Does this contradict everything? No, there are probably shorter humans among the "Nordics" too.

In UFO/contactee lore, the "Nordics" are most commonly described as about **6–7 feet tall (1.83–2.13 m)**—so tall, but not necessarily gigantic.

Mainstream

Mainstream says: "Jesus was likely between 5 feet 1 inch and 5 feet 5 inches (155 to 165 cm) tall, based on archaeological data and historical averages for men in first-century Galilee."

But there's just one tiny problem: that doesn't fit the Shroud itself! Hint, hint.

Once again, mainstream: *"Please ignore the suspiciously tall man on the cloth!"*

If mainstream skepticism had its way, Jesus was basically just some short Jewish liar who made outrageous claims, got crucified, stayed dead forever, and was definitely not the Son of God because God Himself was fiction anyway.

Then comes the forensic reconstruction: olive-brown skin, dark brown or black hair, dark eyes, and probably short hair because that was more common at the time.

So apparently we've gone from the radiant, long-haired Christ of Christian tradition to:

"Here is Dave from first-century Galilee. He's 5'4", has a sensible haircut, lied about being divine, died, and stayed dead. Please move along. Nothing to see here."

At this rate, the next reconstruction will have Jesus explaining to the apostles that resurrection is scientifically unsupported.

Hogwash, I tell you. **Hogwash!**

The Pointed Point

Skeptic: "How convenient. The pointed ears don't fit your world-view, so you just dismiss them. Admit it—you cherry-pick the parts you like."

Me: No, I'm simply following the evidence and the logic. If the earliest traditions consistently described elves as having pointed ears, then yes, that would be something my hypothesis would have to account for. But they don't.

Ancient European supernatural beings weren't consistently described with pointed ears. In Norse literature, for example, the *álfar* (elves) aren't defined by the stereotypical long, pointed ears we associate with fantasy elves today.

The deeper visual ancestry of pointed ears probably comes partly from classical mythology. Greek and Roman artists depicted beings such as **satyrs, fauns, and Pan** with animal-like or pointed ears. European artists later inherited this visual vocabulary for depicting beings that were human-like but *not quite human*.

During the medieval and especially Victorian periods, European folklore and illustration increasingly blended elves, fairies, goblins, pixies, and other supernatural beings. Pointed ears became an easy artistic signal: **this looks human, but isn't human**.

So I'm not throwing out an inconvenient piece of ancient evidence. I'm questioning whether it was ancient evidence in the first place. If pointed ears were a later artistic convention rather than a consistent feature of the earliest accounts, then there's nothing dishonest about separating the later imagery from the older tradition.

That's not cherry-picking. If anything, assuming modern fantasy imagery must accurately represent what the oldest sources said would be the mistake.

The Ancestral Humanoid: We Are All White!

Suppose life does not begin on the exposed surfaces of planets. Suppose instead that the natural womb of complex life is inside the planet itself.

This single change of perspective would radically alter the story of human evolution. In the conventional picture, humanity developed on Earth's surface, with *Homo sapiens* emerging in Africa and populations subsequently spreading throughout the world. Differences in skin pigmentation are therefore understood primarily as adaptations to different levels of solar ultraviolet radiation.

My hypothesis begins one step further back.

I propose that the deepest ancestry of intelligent life is planetary rather than terrestrial in the ordinary sense: life begins within worlds, develops around an internal plasma sun, converges upon the humanoid form, and only later reaches the external surface.

If this is true, then what we call humanity may represent a surface branch of something much older.

The Planet as a Womb

A planet, in this model, is not simply a dead sphere of rock upon whose exterior life happens to appear.

It is a generative system.

Its interior provides an environment in which life can originate and develop, centered upon an internal plasma sun. The planet therefore functions almost literally as a womb: life develops within it before eventually emerging into the radically different environment of the external world.

If this process is a general feature of inhabited planets rather than an accident peculiar to Earth, then evolution throughout the universe repeatedly begins from similar initial conditions.

That matters enormously for convergent evolution.

Convergent evolution occurs when organisms independently acquire similar characteristics because they face similar problems. Eyes, wings, streamlined bodies, and other biological solutions have appeared independently multiple times on Earth.

I extend this principle much further.

If intelligence places sufficiently strong constraints upon anatomy—requiring manipulation, sensory organs, locomotion, a large centralized brain, communication, and so forth—then evolution may repeatedly converge upon something resembling the humanoid form.

Two arms. Two legs. A head. Forward-facing sensory organs. Hands capable of manipulating the environment. An upright posture supporting increasingly sophisticated interaction with tools and other intelligent beings.

The humanoid would therefore not be an evolutionary freak.

It would be one of Nature's recurrent solutions to intelligence.

Convergence Goes Deeper Than Anatomy

But my argument does not stop with the body plan.

If intelligent life repeatedly develops inside planets, then independently evolved humanoids would not merely face similar anatomical problems. They would begin under similar environmental conditions.

This creates two parallel forms of convergence.

The first is morphological convergence:

similar evolutionary demands → humanoid anatomy.

The second is environmental convergence:

similar planetary interiors → similar selection pressures → similar pigmentation.

This distinction is important.

I am not arguing that humanoids must have light skin because they are humanoid. There is no necessary connection between possessing two arms and possessing a particular amount of melanin.

Rather, I am arguing that if humanoids repeatedly originate inside planets illuminated by broadly comparable plasma suns, then they repeatedly begin their evolutionary histories under broadly comparable radiation conditions.

If those internal suns produce substantially less harmful ultraviolet radiation than ordinary surface exposure to stars, there would be correspondingly less evolutionary pressure for heavy protective pigmentation.

The recurring ancestral humanoid could therefore tend toward light or lightly tanned skin.

Under the hypothesis, this would not be an ethnic peculiarity. It would be an environmental consequence.

The Default and the Adaptation

This leads to a reversal of the way human pigmentation is normally imagined.

Rather than beginning with a heavily pigmented surface population from which some populations subsequently became lighter, imagine that humanity's deeper ancestry begins with relatively lightly pigmented humanoids living within Earth.

Eventually, some of these beings reach the surface.

Now the environment changes dramatically.

For the first time, populations are exposed to the external Sun, with radiation conditions unlike those surrounding the internal plasma sun. Different surface populations encounter different UV intensities depending upon latitude, altitude, climate, migration, and lifestyle.

Pigmentation begins changing accordingly.

Populations exposed to intense UV acquire greater protective pigmentation over generations. Populations living under weaker UV retain lighter pigmentation or evolve toward it.

In this model, therefore, the ancestral interior phenotype and the later surface phenotypes should not be confused.

Dark skin would represent neither inferiority nor a fundamentally different humanity. It would represent surface adaptation.

Likewise, light skin would not represent superiority. It would simply remain closer, in this particular characteristic, to the hypothetical phenotype produced by the ancestral interior environment.

When I call this phenotype a "default," therefore, I mean evolutionary starting condition, not hierarchy.

The Puzzle of the Palms

One small observation becomes interesting when considered from this perspective: people with very dark skin generally have much lighter palms and soles.

Conventional biology has an explanation for this. Pigmentation is regulated differently in palmoplantar skin, and these regions consequently remain much less pigmented than surrounding skin.

That's the mainstream view—but by itself it does not establish the historical direction of pigmentation change.

Consider two possibilities.

Perhaps our ancestors were already dark, with palms becoming or remaining comparatively lightly pigmented because strong pigmentation was unnecessary there.

But the reverse historical possibility can also be imagined.

Perhaps an ancestral population possessed relatively light skin across the body. After entering a high-UV surface environment, increased pigmentation was strongly selected across exposed areas, while palms and soles experienced much weaker pressure to change.

Under that scenario, the light palm would not be something that had to become dramatically lighter. It could instead represent a region that changed much less than the surrounding body.

This does not prove the hypothesis. Pale palms cannot tell us by themselves which evolutionary direction actually occurred.

But neither can pale palms, by themselves, rule out the retention scenario.

The observation becomes interesting only in combination with the larger hypothesis of a low-UV ancestral environment.

Are We Really "All African"?

Modern human genetics strongly supports a recent African origin for *Homo sapiens*. My hypothesis does not necessarily have to deny that finding.

It questions whether this represents the ultimate beginning of the story.

Suppose a population originating within Earth reached the surface and eventually established populations from which anatomically modern surface humans descended. A later population expansion occurring in Africa could still leave the genetic signature from which present-day humans trace their recent common ancestry.

In that hypothetical scenario, saying that modern humanity has African ancestry would remain correct at one level of the story.

But Africa would not be the ultimate origin of humanity.

The deeper story would be:

Inner Earth → surface populations → African population history → global migration.

We would therefore all be African in terms of our comparatively recent surface ancestry while simultaneously being, at a deeper level, descendants of Inner Earth.

The two propositions are not logically contradictory because they refer to different depths of ancestry.

Nature's Recurring Humanoid

The larger implication extends far beyond Earth.

If planets repeatedly function as wombs for life, if their interiors repeatedly contain plasma suns, and if intelligence repeatedly converges upon the humanoid body plan, then the universe could continually produce beings that look surprisingly familiar.

So, what am I saying?

I'm saying that the universe creates humans, and every time, the default is white humans because of the environment in which humans first evolve: inside the planet.

Yes, I'm saying there is no such thing as a black race. *All humans are white.* "Blackness" is an adaptation.

And I guess someone can play the racism card, but I don't care about that. I care only about humanity and the real cosmic truth:

Planetary interior → plasma sun → life → intelligence → humanoid convergence → low-pigmentation ancestral phenotype → emergence onto the surface → adaptation to external stellar radiation → diversification of pigmentation.

If that sequence is universal, then the human story is only one instance of a cosmic process.

Why White?

Because:

A life-bearing inner sun must provide usable energy without constantly destroying complex molecules. Therefore, the radiation actually reaching organisms would likely be comparatively gentle. If UV exposure were low, there would be less evolutionary pressure for heavy eumelanin pigmentation, making relatively light skin a plausible ancestral phenotype.

Note: What I wouldn't conclude is that this makes existing humans of different pigmentation literally members of a biological "white race." White and Black are human racial categories (fiction), whereas what my hypothesis actually predicts is a recurring pigmentation phenotype. A hypothetical pale humanoid that evolved independently on another planet wouldn't thereby be European or part of an Earth racial population!

Someone reading this far into the chapter must surely suspect me of being a racist. Why write an entire chapter arguing that Black people don't really exist as a separate race and that white is Nature's eternal default?

My answer has two parts:

1. I care about the truth above all else, so I will state what I believe to be true regardless of how uncomfortable or controversial it may sound.

2. They called **Graham Hancock** a racist, and that pissed me off enormously! So now I'm deliberately writing what I believe to be the truth without sugarcoating it. If telling the truth makes you a racist, then the darkness has won.

See? Can't even use an old analogy!

Fair. I did write, "the default is white humans" and "there is no such thing as a black race. All humans are white."

Those sentences are doing something substantially different. "White" has switched meanings. Sometimes it means *low pigmentation*; sometimes it means a *racial category*.

I mean **low pigmentation**. But people will read racial category, and I can't blame them, because I deliberately wrote it to look that way.

And why did I do that?

Again, partly because of all the bullying directed at Hancock, and partly, I guess, for the shock value.

But my actual idea is this:

There are no fundamentally separate Black and White kinds of humans → pigmentation is an adaptable phenotype → under my hypothetical universal interior environment, the recurring ancestral phenotype would be lightly pigmented.

See? I did it again!

Then you might say: “So you don’t care if this sounds racist?”

My answer: **No, I don’t**—because I’m not interested in thinking about humanity through the lens of race in the first place. So, if you’re not smart enough to figure that out, then by all means, call me a racist. I’m interested in discovering the truth about our past. That’s it.

To me, the racism question becomes a **distraction used to draw people away**. If you can convince people that Hancock is a racist, then perhaps they will stop looking.

And then they will never see what Hancock sees.

What if the Atlanteans were white? What if the Inner Earthers are white? What if Jesus was white? Then we could NEVER get at the truth, because every time someone gets close, you play the racism card.

So:

Calling me a racist is like calling Socrates a ballerina.

“What do you think about ballet, Socrates?”

“I don’t know. I was talking about the nature of truth.”

“Exactly what a ballerina would say.”

That’s how the accusation feels to me. I’m not approaching this through the world of racial politics in the first place. I’m trying to

figure out what is true about humanity's past. Calling me a racist doesn't answer the argument any more than putting Socrates in a tutu answers a philosophical question.

It's just a distraction.

Although, admittedly, Socrates in a tutu would be **extremely distracting**.

And if *Atlantis: The Lost Empire* (2001) is any indication, the Inner Earthers aren't white like "an Englishman who hasn't seen daylight since November."

Of course, Disney isn't evidence for what a hypothetical Inner-Earth population would actually look like—well, unless some Freemasons had a hand in that movie as well...

Shroud of Turin: Ascension

Some will claim: The Shroud of Turin is a miracle, evidence that our world is ultimately supernatural!

My reply:

I hate to be the one to tell you this, because I like to think of myself as open-minded, but... There is no definition of the **supernatural** that survives scrutiny because scrutiny itself is not supernatural. By that I mean: when people try to fully pin down “the supernatural” in a precise, non-handwavy way, they tend to end up with:

- Part of nature (just a deeper layer of reality).
- Undefined or self-contradictory.
- Or it becomes so abstract that it no longer clearly refers to anything.

You could say: the supernatural is that which breaks causal closure itself, not just adds another layer.

But causality could be just a tool of the animal mind. If you are an idealist like me, then causality is not the final picture. So things appear logically not because reality is a set of dominoes, but because the mind orders things. Beyond that, reality may not be describable by causality at all, but that doesn't mean reality behaves chaotically; nature could still seek balance and be self-sustaining. For example, if the initial state of nature is timeless, then timelessness is not made up of dominoes (causality), but it is still orderly. I would argue causality breaks order because causality ultimately leads to paradox, like infinite regress; thus causality cannot be part of reality itself.

As an idealist, all that exists is consciousness, so if I define that as the natural, then there is nothing beyond that, nothing that is super-natural. If reality is a box and you say there is something outside the box, then I would argue that that something outside would be part of the box by definition. So, in the end, I cannot make sense of the supernatural any more than I can make sense of nonexistence. That doesn't mean the supernatural isn't real, it only means I don't believe it because I can't even begin to understand what it is even supposed to mean.

And more to the point: no definition of the supernatural that I have seen so far actually describes something that is supernatural. Maybe that is because "supernatural" is only a nonsense word when analyzed fully, just like the word nonexistence. When you analyze it, it collapses. So, before I answer what I think the Shroud is, I want to say what the Shroud is not: *supernatural*.

Shroud of Turin: real or fake? If you had to bet, what would you choose?

If I had to place a bet based on the evidence available today, I would bet that the Shroud of Turin is the burial cloth of Jesus.

That is not because the case is closed—it isn't. The Shroud remains one of the most intriguing artifacts ever studied. But if forced to choose, I would lean toward "authentic" rather than "not authentic."

Here's why:

First, let us examine the strongest argument against authenticity so that we can keep it clearly in mind as we proceed.

The strongest argument against authenticity

In 1988, three laboratories independently radiocarbon-dated samples from the Shroud and concluded that the cloth dated to roughly 1260–1390 CE. That result is the single strongest piece of evidence against it being a 1st-century burial cloth.

If the dating sample accurately represented the whole cloth, then the Shroud cannot be Jesus' burial cloth.

The strongest argument for authenticity

The image itself is extraordinarily unusual.

Researchers have noted that:

- The image is extremely superficial, affecting only the outermost fibers.
- It is difficult to reproduce convincingly with known medieval artistic techniques.
- It contains anatomical details that some argue were not well understood in the Middle Ages.
- It behaves somewhat like encoded three-dimensional information when analyzed digitally.

These features have kept the debate alive for decades.

The key uncertainty

Critics of the 1988 dating argue that the tested sample came from a repaired corner of the cloth and may not represent the original fabric.

Supporters of authenticity point to:

- Possible contamination.

- Possible medieval repairs.
- Chemical differences between the sampled corner and the main cloth.

However, it should be noted that these objections remain controversial. Many textile experts and archaeologists are not convinced that they overturn the radiocarbon result.

My probability estimate

If I were forced to assign odds:

- Authentic burial cloth of Jesus: ~80–90%
- Ancient cloth but not Jesus' burial cloth: ~10–20%
- Medieval creation or image formed in the medieval period: ~10–20%

Those are not scientific numbers—just how I would weigh the evidence.

What fascinates me most

The most interesting question is not whether the Shroud is miraculous but **how the image formed**. Even many skeptics acknowledge that no explanation has achieved universal acceptance. Proposed explanations include:

- Artistic techniques.

- Chemical reactions.
- Natural body-cloth interactions.
- Unknown physical processes.

No theory has completely settled the matter.

So if someone offered me even odds and said, “Bet your money: authentic or not?”, I’d bet **authentic**, and I would do so with a high degree of confidence. Here’s the real reason why:

But before I explain what I think the Shroud is, I want to clarify my view on the supernatural.

Let us take a deeper dive here, as I anticipate that this point may draw criticism from religious perspectives.

Supernatural

I do not personally believe in the supernatural because I cannot make sense of it. If the supernatural is defined as non-physical, then even an idealist can still hold that reality follows consistent mental laws without any “miracle layer.” In that sense, “miracle” and “supernatural” collapse into the same idea for me: something that breaks intelligible order. And if something can be explained, it is no longer a miracle; it becomes part of the explanatory structure. So miracles function, in practice, as placeholders for gaps in understanding.

It is true that no scientific principle proves that all causation must be physically closed. “Causal closure” is an assumption, not a theorem. However, if causal closure is false, then a “miracle” is not a violation of laws, but simply an interaction from a higher level of causation.

But at that point, the supernatural dissolves again: higher-order causation is still causation. If it is part of reality, follows consistent rules, is in principle describable, and interacts lawfully with the physical world, then it is still nature—just at a deeper level.

So we arrive at a kind of conceptual loop. Every time we try to define the supernatural in a way that is meaningful, it becomes natural again. And every time we define it in a way that preserves its “beyondness,” it becomes unintelligible. It is like trying to bring an angel into the world: once it is fully observable and describable, it loses what made it “angelic” in the first place. There is no definition of the supernatural that survives scrutiny, because scrutiny itself belongs to the natural order of explanation.

You try to bring an angel down to earth,
and in the weight of the world he forgets how to fly—
his wings fold into flesh,
and what was divine becomes human.

One might try to escape this by saying the supernatural is what breaks causal closure itself, not merely what adds another layer. But even this becomes unclear once we question whether causality is fundamental at all.

Again: From an idealist perspective, causality may not be a feature of reality itself, but a structure imposed by consciousness. Reality appears ordered not because it is a chain of external causes, but because mind organizes experience. Beyond that, reality may not be fundamentally causal at all, even if it is still structured and coherent in some deeper sense.

In that view, causality already breaks down as an ultimate principle, and with it the idea of a “miracle” as a violation of causality also collapses. If all that exists is consciousness, then defining reality as “natural” leaves nothing outside it. The idea of something “supernatural” becomes like the idea of something outside a totality: anything described as outside is already conceptually inside by definition.

So I cannot make sense of the supernatural in a coherent way. That does not necessarily mean it is not real; it means I cannot assign it meaning without it collapsing into either nature or nonsense.

Ultimately, this becomes a semantic problem: whenever “supernatural” is given enough structure to be meaningful, it becomes natural; and whenever it is defined in a way that preserves its transcendence, it loses meaning.

To make it perfectly clear: I hold that nature is a single unified reality and that it cannot be meaningfully divided into separate parts; any such divisions are ultimately an illusion. There are no true boundaries within nature. In philosophy, we must define our terms carefully, and I define this unified reality as nature. Therefore, by definition, the supernatural cannot exist.

Again: If you define nature as everything that exists, then your conclusion is true by definition: nothing can be “outside” it, so “supernatural” becomes impossible. In other words, I’m not discovering that the supernatural cannot exist—I’m choosing a framework in which the term supernatural is excluded from the start. And that’s perfectly valid as a philosophical position, but it’s semantic closure, not an empirical or logical refutation of other views. But then those other views also have to define what they mean by “supernatural,” and once they do, they will likely fall under my umbrella once again. That is to say, if you want to play the game, you have to follow the rules.

If someone uses a term like “supernatural” in a discussion, then to have a meaningful debate they have to define it in a way that:

- is internally consistent
- is not just a floating contradiction
- actually connects to something we can reason about

Otherwise, the word doesn’t carry information. If you enter a philosophical discussion, you have to accept that terms need to be defined and used consistently. Otherwise, you’re not really playing the game of philosophy.

Again:

A critic might accuse me of engaging in semantic word games rather than doing real philosophy. They might claim that I have simply defined the supernatural out of existence.

But to be fair, that was never really my argument. My argument is that divisions are ultimately an illusion; therefore, nature is whole.

That whole I assign the name “natural” because if you want to assign it the name “supernatural,” you can do that, but then the supernatural kind of implies that there is also something natural, otherwise you would not need the prefix “super,” but since I already assigned the whole a name, there is simply no room for both concepts. Thus, my argument here is not primarily definitional, but ontological:

1. Reality is fundamentally one unified whole.
2. Any divisions within it are conceptual overlays, not real separations.
3. I assign the name “nature” to this indivisible whole.
4. “Supernatural” only makes sense if there is a contrast class—i.e., something outside, beyond, or other than nature.
5. But if reality is genuinely one whole, there is no coherent remainder or “outside” from which a “super-nature” could be distinguished.
6. Therefore, the concept “supernatural” cannot refer to anything real within this framework, because it presupposes a partition that does not exist.

But to be even more fair, I haven’t actually shown that nature is one, and ultimately that is a belief too. But I just can’t see how there can be any real separation in nature. If you separate water and air, you are not really separating nature from nature; there is still a thin membrane that sits atop the water’s surface, and if you had a huge compressor and took the water, air, and membrane and compressed

them, you could remove that separation. And other separations, more metaphysical ones, are still derived from our picture here. I just don't see how nature could be anything other than a great oneness in the end.

Now, let us turn to the Shroud.

The Shroud of Turin

If the Shroud of Turin is real and it is not supernatural, if Jesus really did die and then resurrected, how do we explain that?

I explain it in terms of an advanced human science by a human civilization that modern science considers pseudoscience, namely Graham Hancock's lost civilization. To be fair, Hancock does not believe that this civilization, call them Atlanteans or whatever, were that advanced, but I think they were, because it is quite frankly impossible for me to explain all the occult knowledge of the world without resorting to it. And the megalithic work itself speaks of something highly advanced, someone who had a higher IQ than we do today.

Personally, I blame the philosopher's stone. They weren't smarter originally, but became smarter upon consuming the grand elixir. And even if that wasn't enough, you need to explain sacred geometry, and that alone tells me we are dealing with something or someone way smarter than us.

Then we have the UFO phenomenon that our government says is real, and the fact that they are not freaking out tells me they are not aliens. So, when you put two and two together, you realize we are dealing with a supercivilization.

Then we have the Nazis trying to find this supercivilization. So if they built what we call UFOs and part of their science leaked into our world under the umbrella of alchemy, and alchemy tells us all is mental, then when you put four and four together, you get the realization that their science was one of consciousness, which means what we call ascension, the kundalini thing, was not a belief but a **real science**.

So my bet is that Jesus did resurrect and become a being of light, whatever that means, through their advanced science, which is why we find the imprint on the Shroud.

That is, Jesus was either a surviving Atlantean, a member of the inner Earth civilization that the Nazis tried to find, or someone who simply knew of their vast science.

But then you say, Atlantis fell some 12,000 years ago; if Jesus was a surviving member, he would be like 10,000 years old at the time of his death and resurrection. My reply: yeah, but Manly P. Hall believed that immortals walk among us. That is, the philosopher's stone grants you longevity.

But I confess that maybe you could live for a thousand years or more, but 10,000 is a bit of a stretch, even for me. So maybe he was of

the inner Earth civilization who came to the surface to unite mankind. Something like that.

The big question then becomes:

Is Jesus God?

Personally, I would say “yes,” because I have defined God as the universal mind in idealism. That is the only sensible definition of God that I can see. So, I think Jesus was a member of this inner-earth civilization, and that this civilization discovered God through their science—that is, they confirmed that God is real. And Jesus simply told the truth: his “Father” is real.

Then, just like a real metal plane sitting in a jungle somewhere, the jungle people—us—come and make replicas out of straw and call them the real thing. These straw planes I call religion. But rest assured, there is also a real plane—one made of metal.

So yes: **Jesus is God.**

Why?

I say: Why don't they just test other parts of the Shroud and settle the debate once and for all?

The fact that they refuse to test it, just like in Egypt, where they refuse to test the Khufu graffiti, I'm not gonna lie, smells like fakery to me. I get that they don't want to cut into it if it is real, but at the same time, if Jesus were here, I'm sure he would reply: I had to suffer and die for all of you to produce this evidence—real evidence—and you don't even want to test it?! I'm so pissed right now. This is why I did it in the first place: to prove to you the world is not material, but immaterial, even though it looks material. If my father is real, he can withstand any test of science. **So what are you afraid of?**

I believe this to be true: even if you did real, proper science and arrived at a conclusion that is reasonably valid as far as science can take it, if it didn't align with the mainstream view, the mainstream would find a way to explain it away. I mean, there is no way in hell science would say Jesus rose from the dead.

Still...

Even if I did not believe in Atlantis or an inner Earth civilization, I would still lean toward the Shroud being authentic. Here is why:

I mean, the biggest mistake would be to treat the radiocarbon dating as one piece of evidence and the image formation problem as another equally weighted piece. They are actually different kinds of evidence.

The real disagreement is over how much weight to assign to an apparently anomalous radiocarbon date versus an apparently anomalous image. Reasonable people can differ on that.

Personally, I think radiocarbon dating is a flawed science, because what if the Great Flood happened—wouldn't that just mess with everything? How stable are the assumptions behind scientific dating systems if there were unknown global catastrophes? If we assume that a global flood happened (a Noah-type event), that the flood is not correctly recognized by modern science, that the Great Pyramid of Giza was built before the flood, and that radiocarbon dating is applied in this world without knowledge of that event, then the pyramid's radiocarbon-based placement would be systematically misaligned with its true age. I'm not saying you cannot date the Shroud; all I'm saying is that the evidence that the image on the Shroud is still a huge puzzle should weigh **more** than treating our dating methods as infinitely reliable, because they are not.

That is, many skeptics overstate the case. The Shroud is not a simple medieval painting that has been conclusively explained away. The image has features that remain difficult to account for.

The strongest pro-authenticity argument isn't merely that the image is hard to fake. It's that:

- The image is extremely superficial.
- It isn't obviously painted.
- It appears to encode some form of 3D spatial information.
- It corresponds in many ways to a real crucified body.
- No universally accepted reproduction method exists.

Those are legitimate points.

Skeptics often act as though the image formation problem is solved when it really isn't. If you ask a real scientist, instead of a skeptic on YouTube, whether they think the image has been adequately explained by conventional medieval artistry, the answer is **no**.

A Ship in a Bottle

Still, history is full of cases where people said:
"Nobody could have made this."

And then later somebody figured out how it could have been made.

So, if it was faked, then perhaps Tim Hogan is right, and this was the work of *Leonardo da Vinci*. However, what if Leonardo was one of the immortals that Hall warned us about? That would complicate things. I mean, it would be no problem for an immortal to fake their birth and death.

That said, if tomorrow a new, carefully controlled dating study on multiple locations of the cloth produced a 1st-century date, I think the

academic world would be thrown into absolute chaos. The Shroud would instantly become one of the most important artifacts ever discovered.

If someone handed me the cloth with no history attached and asked:

"Could a medieval artist have deliberately created this image?"

I would have a hard time answering yes with confidence.

The image is still the elephant in the room. Even many skeptics admit there is no universally accepted explanation for how it formed.

The real question is whether an unexplained image outweighs a radiocarbon date. That's where reasonable people can disagree. And you have my answer: I want real science, not dismissal by the mainstream declaring the case closed on the basis of "dating". Solve the real case.

Solve the image.

In sum:

The Shroud problem is not solved because the image formation problem is not solved.

The Shroud remains one of the few famous relics where serious researchers on both sides still find aspects of the evidence genuinely puzzling. And I think I can answer why it is puzzling: It is puzzling for the same reason the Great Pyramid is puzzling, which is to say we are dealing with another mystery of this ancient, lost civilization. But this time, we are looking at their most intriguing science: *ascension*.

Buddha

Siddhartha grew up as a prince, raised in luxury inside palace walls. His father tried to shield him completely from suffering—no sickness, no aging, no death.

But one day, Siddhartha secretly left the palace...

The following passage is taken from my first book, *Fairyland*, and was proofread with the help of AI:

I might be candid here, but I will just say it out loud: I have been to Nirvana.

I was lying in my bed with my girlfriend. I was not asleep or anything, no drugs, nothing, not even a beer. Nor did I meditate. And then I woke up. Literally.

I have had other spiritual experiences as well. But that is for another time.

When God is sleeping, he is sleeping. I know, because when I “fell asleep” in Nirvana, I woke up here. So every day I’m like:

“I’m dreaming awake!”

This universe is literally a dream. When the Buddha tells us to wake up, it is not poetry or metaphorical talk. It is literal.

Physicists have suggested that we may be living in a kind of hologram. Imagine when they discover that it’s all a dream. I would like to see Brian Greene host that show.

And what is Nirvana like? Obviously, words don’t cut it. And it’s not like there is a sign that says: *“Welcome to Nirvana. The Land of the One.”* “Nirvana” is just a word that I use. But let us paint a picture anyway.

So, what is it like to be God?

Answer: 100% natural.

The analogy is this: you are dreaming, and then you wake up. When you wake up, you become yourself again. Likewise, it is 100% natural to be God, because you are God. You wake up, literally.

And when you wake up, there is no sense of space and time. Your consciousness is light as a feather. It is a sober, pure, and humble consciousness. God is not like Zeus! Or, to put it another way: it is an

AWESOME consciousness. You have no idea how awesome it is. It is a different perspective.

Moving on: you do not have a body. You exist in an ocean of white light. You are bigger than the universe, so to speak. You are in another dimension. You are no longer human; you are something “more.”

And you are the only one who exists, and so naturally you do not care about other people. Everything is okay and will always be okay. You are immortal. You just are. End of story.

You know everything as you know you are conscious. It is a direct knowing. But let us not digress.

“Other people” = illusion. And you do not care about phantasms.

No help will come from God because... you are God. Likewise, your physical body cannot help you when you are off in dreamland. But there are other ways the body can help you, so help will come. But the point is, it is not like you think.

Like any dream, you will wake up. It happened to me.

To be God is not scary; it is the most natural thing in the universe. And you evolve. It is not that you are static. But one thing is for sure: human consciousness is heavy.

It is something you feel upon re-entry to this dreamland we call the universe.

But Nirvana is white light and what you would call home. Real home. But there is no television there. Thus, the notion that God is creating this universe so that he can experience things (and evolve) is something I have also felt.

However, there was a deeper purpose to it. I had to go back to sleep. I had to. Sleeping, that is, being awake in the universe, was important. Like a job that needed to be done.

It is like a hive mind, and we are the hive mind. However, the hive mind also needs to work in order to survive, and that requires ants. Therefore, the hive mind has no choice but to leave its center of consciousness and become the ant for a while. The ant's consciousness is a part of the hive mind. The ant does not have a consciousness independent of the hive mind. We are all dependent on God.

We are worker ants, and we do not know the purpose of our job. We just work. Alternatively, most of us slack and wait for a carcass to arrive!

Buddha

The Buddha usually refers to **Siddhartha Gautama**, a historical teacher from around the 5th–4th century BCE in ancient India.

He taught a path focused on understanding suffering, how it arises, and how it can end. The core ideas are often summarized in the Four Noble Truths and the Eightfold Path. In very simple terms, his message was: suffering comes from craving and misunderstanding reality, and freedom comes from seeing things clearly and letting go.

“Buddha” is not a name but a title meaning “*the awakened one*.”

But what do you awaken from? A dream. What is the dream? The universe.

I experienced this for myself, so I know it to be true. And you have just read the copy-pasted experience from my first book.

So, knowing the universe is a dream, I will now break it down logically. Here is my chain:

First, you try to solve the hard problem of consciousness, and you cannot do it. A reasonable person would then conclude that idealism, and not materialism, is true. If idealism is true, then all is mental. So we start with the cosmic mind.

From here, we can argue that you cannot separate the cosmic mind into pieces. But at the same time, the cosmic mind appears to be separated into pieces (us). Philosophers like Bernardo Kastrup address this with the idea of dissociation.

Dissociation itself suggests the universe is dream-like, because we are dissociated alters rather than actually inhabiting base reality.

You could further argue that the only way to “escape” base reality is not possible, because the cosmic mind is base reality. Any “escape” would therefore be another alteration, another illusion.

Then you can make the argument that everything we observe in nature is fractal. If we can dream, then perhaps that fact is a fractal expression of a much larger cosmic dream.

But then the question becomes: how do you actually create a universe where none existed? The only way we know how to generate worlds is through dreams. So perhaps reality itself is a dream.

I think so.

It is not as if the cosmic mind has a supercomputer available to simulate “game worlds” to put us in. And it is not as if there exists a physical box in which we can place “physical reality.” So what is the universe floating inside?

I know physicists have their own perspective on this, saying you don’t need a box to contain space. But philosophically, this feels unsatisfactory to me, because we are dealing with 3D space at the end of the day, not abstract mathematics.

Thus, to me, you cannot have a universe existing independently of mind. It makes no sense. You need a box, a container, and that container is consciousness. And consciousness does not need a container because it is not a 3D thing.

All in all, the universe being a dream, literally speaking, is entirely possible.

A Shared Generative Topology

Again: If nature is fundamentally self-similar, then dreaming may be a fractal expression of a larger cosmic process. Under idealism, the individual mind and the cosmic mind would share the same generative structure, making a dream-like reality not a metaphor but a consequence of self-similarity across scales.

Space X

You say: “General relativity is rejecting that space must be a thing inside something else.”

My reply: A conceptual boundary shift doesn’t actually answer the question.

You say: "In physics, there is no 'outside viewpoint' of space-time built into the theory. 'Inside space' is not a relation defined from outside space; it is a relation defined within space. That's not word-play—it's how coordinates and measurements actually work."

My reply: That doesn't answer anything at any philosophical level. It is just a trick—and a bad one.

You say: "If space is in X, what is X in?"

My answer: Consciousness. Can the universe be self-contained without any external embedding? No, it cannot. And you can bootstrap the universe using Klein bottles all day long, but at the end of the day, materialism and universes existing independently by themselves, floating around in nothing at all, make no sense.

You say: "GR is not 'dodging' the question—it removes the assumption that generates it."

My reply: Let's agree to disagree. You physicists don't understand philosophy at all, though some of you try. Even Michio Kaku understands this; he understands the philosophers here, so he answered 'hyperspace'. That is at least an attempt to answer it, and not just dodge it and hide behind mathematical tricks like 'GR is rejecting that space must be a thing inside something else.' No, you don't get to reject that and still make sense because we live inside 3D space.

Don't you understand that we are inside a 3D environment, which means you can move in a direction? So what happens if you go in one direction endlessly? Do you hit a wall, do you loop back on yourself,

or do you eventually reach an “edge” and say, “Oh, now I finally understand what modern physics means by a conceptual boundary shift”?

Come on, dude. They are dodging the question!

All three options are absurd. There is no wall. You don’t loop back like you’re trapped in some logical nightmare where Earth’s surface became an analogy the universe took too literally. And there is no vague “conceptual boundary shift” either. And if space is simply infinite, that doesn’t resolve anything—it just turns nature into an actual living paradox of infinite regress—but this one is real, and it’s coming for you! Something is still off.

Then you say: “What if the universe is a giant black hole and we are inside it? Then the edge of the universe would be a black hole, and thus there would be nothing ‘outside.’”

My reply: This is close to my solution, actually. But if you follow that logic to its conclusion, you would understand that nature is symmetric and you would end up with a dual torus that actually solves the container problem. On the dual torus, expansion is met by contraction, so you never actually “expand” into something—you remain zero-dimensional forever. This must then mean that 3D space is a projection of the animal mind from a deeper 0D layer.

Space needs a box... a container... and that container is consciousness. And whatever happens at the “edge,” the mind simply resolves it internally. The universe is an interface of the animal mind, like Donald Hoffman suggests.

Then you say: “What if the animal mind just generates a wall at the edge?”

Then I’d say: **Touché.**

And if you say, “It’s like asking: what is north of the North Pole?”—then I would say that you’re the one lost inside a nightmare.

Physics keeps dissolving the question instead of meeting it head-on.

You physicists make no sense. It feels like mathematical formalism is being used to smooth over something much more basic: that materialism doesn’t actually answer where reality is *grounded*.

You don’t get to have a self-existing universe, floating on nothing, complete with four elephants and everything, and call it done.

Jesus is God

In the previous chapter, I concluded that Jesus is God. What about the Buddha? Is the Buddha God too? My answer: **yes**. In the end, we are talking about the *oneness* of nature.

Santa Claus

Santa Claus is a legendary figure associated with Christmas who is said to deliver gifts to children on Christmas Eve. The modern Santa is a blend of historical figures, folklore, religious traditions, literature, and commercial imagery that developed over many centuries.

Historical Origins

The most important historical figure behind Santa Claus is *Saint Nicholas*.

Saint Nicholas was a Christian bishop who lived during the 4th century in the city of Myra (modern-day Turkey). He became famous for generosity, especially helping the poor and secretly giving gifts to those in need. One famous story tells of Nicholas secretly providing money to poor girls so they could marry rather than be sold into slavery.

Over time, Nicholas became one of the most beloved saints in Christianity and the patron saint of children, sailors, merchants, and many others.

The linguistic path from Saint Nicholas to Santa Claus is actually fairly straightforward:

- Saint Nicholas → Dutch *Sint Nikolaas*
- Sint Nikolaas becomes contracted in speech to *Sinterklaas*
- English speakers in colonial America hear Sinterklaas and gradually anglicize it into *Santa Claus*

That's not unusual. Languages constantly transform names over centuries.

The more interesting question is: **How do you get from a 4th-century bishop to a magical immortal who lives at the North Pole, knows who's naughty or nice, flies through the sky, enters houses supernaturally, and delivers gifts worldwide in a single night?**

The mainstream explanation is that many traditions merged:

- Saint Nicholas supplied the gift-giving aspect.
- European winter spirits contributed supernatural elements.
- The English figure Father Christmas contributed festive imagery.
- Folklore added magic and wonder.
- Nineteenth-century American writers systematized the story.
- Commercial culture spread a standardized image.

Critics sometimes argue that this explanation can feel like a "just-so story" because no one sat down and consciously invented Santa. In-

stead, historians reconstruct a gradual evolution from scattered evidence.

The alternative is to propose that the Santa figure emerged from something deeper—a universal archetype of the benevolent old wise man, gift-bringer, or winter king. This is closer to the approach of Carl Jung, who might say that Saint Nicholas survived and transformed because he resonated with an archetypal pattern already present in the human psyche.

In that sense, Nicholas may not be the origin of Santa so much as the historical vessel through which an older archetype expressed itself.

But, personally, I don't believe in coincidences or explanations that "save" the mainstream from embarrassing moments. I have always believed in logic, **real logic**. To me, the only logical explanation for Santa Claus is that there is a deeper layer in society that consists of secret brotherhoods and elites pulling the strings behind the curtain. In this view, Santa Claus exists because he contains esoteric knowledge that is then spread out to the unwitting masses.

Then you say: "The more power and coordination you assign to hidden actors, the more evidence we should expect to see."

My reply: no, not if we believe Manly P. Hall and that real immortals walk among us, and that they are the true preservers of ancient knowledge and the real hand behind the secret societies.

In this view, Santa Claus preserves the greatest knowledge of all: the knowledge of **ascension**—how you can, like Jesus Christ, resurrect and become a being of light.

Let us now turn to the common theory, how the internet says it is supposed to work:

Santa Clastrum of the North

Here's the reconstructed version of how that Santa-clastrum-Kundalini theory is intended to work as a system.

The “Clastrum—Claus Consciousness Code” (as proponents frame it)

1. Core assumption: language hides biology

The theory starts with a premise:

Ancient religious and mythological systems secretly encode biological and neurological truths in symbolic form.

So instead of myths being stories, they are treated as:

- encrypted neuroscience
- symbolic anatomy
- disguised consciousness maps

2. The name “Claus” is treated as a biological clue

The key move is linguistic pattern matching:

- Santa Claus → “Claus”
- Claustrium → “claus- / claus-”
- Latin claustrium = enclosed hidden chamber

The theory claims:

“Claus” is not random, but a preserved fragment of an older symbolic reference to a hidden brain structure.

So the similarity is treated as:

- intentional encoding, not coincidence
 - phonetic survivability of a deeper concept
-

3. The claustrum is reinterpreted as the “seat of unified awareness”

In neuroscience, the claustrum is a thin sheet of gray matter only a few millimeters thick. Despite its small size, it is one of the most densely connected structures in the mammalian brain. Because it receives inputs from and projects back to nearly the entire cerebral

cortex, neuroscientists suspect it plays a critical, overarching role in higher-order cognition.

In the theory, it becomes:

- the “switching center of consciousness”
- the point where all sensory input is unified into one experience
- the “inner chamber” where reality becomes singular

So it is redefined as:

the biological interface of consciousness itself

This step is essential because it turns anatomy into metaphysics.

4. Santa Claus becomes a symbolic model of consciousness flow

The myth is reinterpreted as a process diagram:

Santa’s features are mapped like this:

- North Pole → “axis of higher consciousness” (top of system)
- Workshop → subconscious production layer
- List of who is good/bad → moral information processing
- Flying globally in one night → non-local awareness
- Gifts → insights, neural “downloads,” awakening moments

So Santa is reframed as:

a personification of a consciousness system distributing “information packets” into minds

5. The chimney = the neural conduit

This is one of the central symbolic moves.

The chimney is interpreted as:

- a vertical channel
- a passage between hidden and visible realms

Mapped onto the body, it becomes:

- spine / central nervous system axis

So the logic becomes:

Santa entering through the chimney = consciousness entering the body through a central vertical channel

6. Kundalini = upward signal in the same system

Kundalini is inserted as the “Eastern confirmation layer.”

It is interpreted as:

- energy rising through the spine

- activation of higher awareness

So the theory links:

- Santa (descending awareness)
- Kundalini (ascending awareness)

and claims they describe the same bidirectional process:
consciousness moves both downward (manifestation) and upward
(awakening) along the same axis

7. The “33 pattern” is used as validation

Numbers are used as reinforcing evidence:

- 33 vertebrae (traditional count, approximate)
- Jesus at 33
- Masonic 33 degrees

The theory treats recurring 33s as:
evidence of a shared underlying encoded structure in human spir-
itual anatomy

8. DMT / fluid / secretion claims (extended layer)

Some versions add:

- cerebrospinal fluid as “sacred fluid”
- DMT-like molecules as “vision triggers”
- brain states as chemically induced “awakening events”

This layer tries to convert symbolic language into biochemical mechanism:

mystical experience = measurable neurochemical activation

9. Final synthesis (how the whole system “works”)

Put together, the theory becomes:

1. The brain contains a hidden integrative structure (claustrum)
2. This structure is the biological “seat” of unified consciousness
3. Ancient traditions encoded this structure symbolically
4. Santa Claus myth preserves fragments of this encoding
5. Chimneys, chiming descent, gift-giving = maps of consciousness flow
6. Kundalini = upward activation of the same system
7. Repeated numbers and symbols are “residual fingerprints” of the code

So the final claim is:

Mythology, religion, neuroscience, and folklore are all distorted surface expressions of one underlying hidden map of consciousness.

My take:

Take the following with a huge grain of salt, because this is just my speculation on the matter. I don't think this internet version covers the whole truth; I believe it is more like a cargo cult phenomenon, where there is a real plane, yes, but that plane has been converted into straw by the jungle people. Basically, the internet version is an imitation of the real thing. Say an inner Earth civilization existed—they had what we call UFOs, and they also had this science of ascension. Then this science finds its way from the inner Earth to our internet. **I don't think the internet version does justice to the real thing.**

So, here's what I think the real thing is like:

33 = this is indicating what ascension is about: the human itself, the *spine*. And yes, this is why Jesus is said to have ascended at 33 years old.

What I believe: Kundalini rising, Jacob's ladder, the Holy Spirit descending, shamanic world trees, mystical ascent traditions, Kabbalah, the Norse version of Kabbalah, Yggdrasil, and the world tree in the Bible—all of them describe ascension. Also, Santa and his chimney.

How it works:

First, you have to realize that all atoms—everything in the universe—is the dual torus in one form or another. Thus, all atoms are toroidal. The chakras in your body are also toruses, spinning

whirlpools. And your whole body is a dual torus system—your aura, the *Merkaba*.

North Pole = top of the head. This is where your dual torus (aura) expands before it contracts again. Or actually, I think it is the other way around—this is where it contracts before it expands again. I don't actually know. Anyway, this is where your consciousness has to exit your body, your temple.

The chimney = your spine, where the energy has to travel to collect information about your whole body and being, which is located in your chakra centers.

So imagine some sort of process starting in the claustrum, traveling down your spine, collecting all the information about you, which is stored in the chakra centers, then going back up again to the North Pole, or the top of your head. And then, if you did everything right, your consciousness will shoot out of your body and into heaven, where it is picked up by greater toroidal fields there, which you will now merge with. You are now on a higher plane of existence. And this process is so intense that your whole body radiates light, and we get the Shroud of Turin.

Basically, your consciousness is trapped in your body because the dual torus is a closed system. So to overcome it, you probably need vast amounts of psychic energy to travel from one torus system to another. Your consciousness is the toroidal flow itself. Normally, your consciousness goes back down again because the dual torus that is you contracts again. So to overcome it, you need to become like a surfer and ride over the waves, so to speak.

Maybe the chakras play a role in ramping up the energy (spin) you need to leave the body, too—like a rocket using a planet to slingshot. The chakras are literally 3D whirlpools.

Santa's Moral Ledger

But what about Santa's list of nice and naughty? We know naughty kids don't get presents. But why?

They say that the higher realms of existence are even more mental than ours. If idealism is true, then all is mental—but on the higher planes, this is even more so. Here, your thoughts instantly manifest. So imagine if you are not a master of your own system (all your chakras), then you will manifest pure nightmares, and you are better off on the lower planes where your thoughts are not so easily turned into reality.

Imagine this Kundalini energy traveling to your root chakra, and the energy picks up that you are a sexual deviant. Then you go to the higher planes of existence and manifest that reality. Not a good idea. A better idea is to be reborn on Earth and learn to become a master before you ascend. That is the thing—you already need to be a master of your emotions before you ascend.

Or: imagine the upper planes are filled with ascended masters already, and that they collectively have great power. Then, if you try to ascend and you are on Santa's naughty list, so to speak, the other

ascended masters will simply block your energy from entering “heaven,” because paradise is made of toruses as well, and the torus is such that it is totally sealed off. It can open from the inside and let things into it, but it can also seal itself off. I think this is the logic behind demon possession, etc.—you need to let them in by your own free will, because your will controls your toroidal system.

For example, Anubis in the TV series *Stargate SG-1* becomes stuck in a “half-ascended” state, so the lesson is: don’t become morally corrupt like Anubis.

From what I can tell, this lost civilization was heavily into the use of psychedelics and developed an entire science around it. So the fairies may be a symbol of DMT entities. Basically, the Christmas gift, then, is the ability to enter heaven itself through psychic energy.

The present beneath the evergreen tree—the tree of immortality—contains immortality itself: *ascension*. Santa, then, is the fly agaric that grows beneath the tree. That is, Santa is the gift, or the tool, you can use to accomplish this great transformation.

Also, everyone says Santa isn’t real. But what if he is? What if Santa is a real intelligence that an inner Earth civilization encountered in their travels into unknown realms of consciousness? We know so little about the psychedelic universe and what it contains. So imagine UFOs descending, out comes a race of superhumans, and all kids everywhere receive the good news: **Santa is real.**

However, all of this is just my own musings. I do not really know. But it is fun to speculate.

Then you say: “But, like, how does it *actually* work?”

My reply: **I don’t know.**

What About the Theory That Santa Was a Mushroom?

That’s actually one of the more famous alternative theories about the origins of Santa Claus, although it remains controversial and is not accepted by most historians.

But then again, what do these so-called experts really know?

The modern interest in psychoactive mushroom symbolism was shaped by the ethnomycological work of R. Gordon Wasson, and later John Marco Allegro extended these ideas into interpretations of early Christianity.

The theory goes roughly like this:

The Fly Agaric Mushroom

The mushroom *Amanita muscaria* is the iconic red mushroom with white spots.

Supporters of the theory note that:

- It is bright red and white, like Santa's modern outfit.
- It grows beneath conifer trees, where Christmas presents are placed.
- It has a long history of ritual use in parts of Siberia.

Shamans and Chimneys

According to the theory, Siberian shamans would collect fly agaric mushrooms and distribute them during winter ceremonies.

Some accounts describe shamans entering homes through roof openings when snow blocked conventional entrances.

This has led proponents to suggest a connection with the image of Santa descending through chimneys.

The historical evidence for a direct connection is debated, and many historians consider this part speculative.

Reindeer

Reindeer are known to eat fly agaric mushrooms.

Some advocates of the theory claim that:

- Reindeer consuming fly agaric inspired stories of flying reindeer.

- The altered states associated with mushroom rituals influenced myths of magical flight.

Drinking Urine

One of the stranger aspects of the theory concerns urine.

The active compounds in fly agaric can pass through the body while remaining psychoactive.

Historical reports describe cases where people drank the urine of someone who had consumed the mushroom in order to experience its effects while reducing some of the toxic side effects.

This is where the popular internet claim about Rudolph, reindeer, and urine originates.

Santa's Costume

Again, supporters point to several symbolic parallels:

- Red-and-white mushroom ↔ red-and-white Santa suit
- Conifer trees ↔ Christmas trees
- Gifts under trees ↔ mushrooms growing beneath trees
- Flying reindeer ↔ reindeer associated with mushroom use
- Winter shaman ↔ Santa Claus

What Do Historians Think?

Most historians remain unconvinced that Santa Claus originated from fly agaric shamanism.

The main objections are:

1. Santa's historical development from Saint Nicholas traditions is well documented.
2. Many alleged parallels may be coincidental or the result of combining unrelated traditions.
3. Direct documentary evidence linking Santa Claus to fly agaric rituals is limited.

So today the "mushroom Santa" theory is usually regarded as an intriguing alternative interpretation rather than a proven explanation.

What's interesting is that the mushroom theory really does point to real historical practices involving:

- shamans,
- reindeer,
- winter rituals,
- and psychoactive mushrooms.

The debate is not whether those practices existed—they did—but whether they significantly influenced the development of Santa Claus as we know him today.

And I think they did! Yeah, I think there's a reason why even Super Mario enjoys mushrooms! If the fly agaric theory is true, then perhaps humanity has been preserving mushroom symbolism for far longer than we realize. Santa Claus has his sacred mushroom, Siberian shamans have theirs, and even *Super Mario Bros.* gains power and grows larger after eating a mushroom.

It feels like someone behind the curtains is pulling some strings. When you start collecting examples—Santa and mushrooms, shamans and reindeer, sacred plants in religion, recurring symbols in myths, Mario's mushrooms, enlightenment stories, world trees, serpents, ascension motifs—it can begin to look less like isolated coincidences and more like pieces of a larger pattern.

There is an intelligence, tradition, or hidden lineage operating behind culture, deliberately preserving certain symbols across time. A single secret cabal directing history. I believe it is so. I believe in Manly P. Hall's "immortals among us."

They say a secret cabal cannot rule the world. I say I agree—if you are talking about normal humans. But these are not normal humans; these are super-humans with very long lifespans and very high IQs due to their consumption of the grand elixir: the philosopher's stone.

Also, organizations such as Freemasonry, Rosicrucianism, and various mystery schools have explicitly used symbolism to transmit ideas. All I'm saying is: dig deeper. A hidden immortal elite has been secretly orchestrating civilization for millennia.

The real **Illuminati**, the *enlightened* ones.

I mean, **Saint Nicholas** is a nice, *convenient* mainstream story for explaining Santa—but come on, does it really explain Santa? Of course not. Not even a little bit.

Santa = Jesus: Ho Ho Holy Theory

So why do we celebrate Jesus and Santa simultaneously? Because the elite knows: Santa = Jesus.

Who was Jesus really? I believe he was an inner earther, the Logos, a mushroom, and the philosopher's stone. He was all of these. He was a title, a science, the road to immortality, real immortality.

I think there exists a supercivilization inside the Earth. They are behind the UFO phenomenon. They also have a science of ascension. This is what Jesus is. So imagine this truth is spread through the surface world, and secret societies get a hold of it. They would then represent Jesus as a mushroom because ascension was a science stemming from the use of psychedelics. To actually ascend, you needed to master your dual torus field, the Merkaba. The geometry underlying the dual torus / the star tetrahedron (which you can see on Israel's flag and South Korea's flag) is the cuboctahedron. The cuboctahedron has 12 vectors—there are your 12 disciples. So Jesus is the center point, the

man on the universal cross, which is the zodiac, which I also believe is derived from the cuboctahedron. The dual torus is the principle of regeneration and cosmic sex, so no wonder Jesus became a mushroom leading a sex cult in the ancient world!

Yasha / Yeshua (salvation, deliverance). “Christ” (Greek Christos, “anointed one”). Nazareth → natsar (to guard, preserve). “Jesus of Nazareth” becomes something like “the initiated one of the hidden tradition.”

So, if the dual torus/cuboctahedron is the Logos, as I argue in my DEMU theory, then Jesus is all of these:

A real man who came to the surface and proved ascension is real. A symbol for the real Logos. And also a manifestation of the Logos, because an ascended master would align with nature’s purpose, which is the Logos. Read about it in my DEMU theory. He was also symbolized as a mushroom because this had ties to the ascension science. And he is the living embodiment of the philosopher’s stone. The philosopher’s stone is physical matter you can eat, but more broadly it is the universal transformation process of matter itself. This inner Earth civilization saw how nature transforms matter and then, I guess, made a science out of it.

Jesus as the Son/Sun

If Jesus is symbolically, as I believe, the cuboctahedron, and the cuboctahedron is the underlying geometry of gravity, atoms, planets, suns, and so on, then Jesus can symbolically be represented as the sun, the light of the world. This is because, supposedly, the sun is at the center of our system, and the sun is a dual torus based on the same geometry as Jesus is. So you begin to see how Jesus as the sun is also encoded wisdom, because astronomical knowledge is the hallmark of this lost civilization. And this knowledge was extremely important, so why not preserve it front and center? The sun “dies” and is resurrected three days later, etc.

Around December 21–22 in the Northern Hemisphere:

- The Sun reaches its lowest point in the sky.
- For about three days, its noon height appears to change very little.
- Then it begins to rise higher again as the days gradually lengthen.

The Sun “dies” on the winter solstice, remains “dead” for three days, and is then “reborn” or “resurrected.”

From this perspective:

- Jesus = the Sun (“light of the world”)
- Death and resurrection = the annual solar cycle
- December 25 = the rebirth of the Sun

Plus, many pagan cultures did celebrate the return of the sun, or the gradual return of light, around the winter solstice. And some say that the sun itself is conscious, so maybe the inner Earth civilization knew about that.

Also: If Jesus represents the cuboctahedron/dual torus, and the white hole side = free energy and matter creation, then our Sun is the white hole that birthed the Earth. This makes Jesus as a sun symbol a perfect match, since the Sun is literally the father of the Earth.

Sunrays 'walking' on water can be seen as a reflection of Jesus walking on water.

Dark Jesus

This one is just my own conspiracy theory, but I think I should share it anyway. I believe this inner Earth civilization contacted the Reptilians, and that there has been a war ever since. And if agents of the Reptilians have infiltrated our world, then they would corrupt it and turn our lion symbols into snake symbols, as it were. I mean, you can explain away all the snake symbolism you want, but I see through all of that.

So why do we get "Jesus of Nazareth"? Then we have NASA, Nazi, Naga, etc. I mean, call it coincidence or false pattern recognition on my part, but I believe there is spiritual corruption going on. I mean, it would be weird if there wasn't.

You may not see a connection, but if I were the leader of a secret society tied to serpent worship and I wanted to reflect that, then I would come up with things like NASA too and say it just stands for National Aeronautics and Space Administration. I would not disclose the fact that I'm secretly into an ancient cult of Jesus (Nazareth), where also the Nazis gained their occult knowledge. On the surface it looks disconnected, but that doesn't mean it is or that I'm bad at pattern recognition, although it could also be a case of pareidolia, as it were.

Anyway, snake symbolism alone is a book in itself. There is a reason why our world is ruled by Satanists!

Satan = Santa = Saturn = Cronus = god of time

And the deepest conspiracy theory we have is the Reptilians and their control of the time loop, the Matrix we are all in. Just ask David Icke.

You say: nonsense conspiracy theory!

My reply: Well, if Donald Hoffman's interface theory is true, and spacetime is an interface of the animal mind, then we get shapeshifting reptilians because they would phase in and out of our reality. That is, they would hack our interface. If they can do that, and they are as advanced as this inner Earth civilization that flies around in what we call UFOs, then why couldn't they hack our interface and put our reality in some kind of loop?

All you need for this to work is to assume humanity is much older than we have been taught, and that convergent evolution will likely make aliens look humanoid. These humanoids will not come in many variations, possibly ape (like us) and lizard/dino (like them). So when our ancestors reached beyond their interface (our universe) and contacted a real alien civilization, they naturally stumbled upon lizard-like beings, as it were.

Then, both being aware of each other, you get a kind of three-body problem, and war follows. But since both parties are inside different universes, different interfaces, you get an interface war instead of a direct confrontation. So this war could last for thousands of years, like a cold war that never ends.

So if you accept these three ingredients, then this conspiracy theory is not so crazy after all:

1. Humans are older.
2. Convergent evolution.
3. High tech.

The skeptic: "Still just BS! You're just stacking speculative ideas on top of each other as if they collectively strengthen the conclusion, when they don't actually connect in a verifiable way."

My reply: You fail to reason on all levels and don't take my claim seriously at all. What I really said was this: If humanity is older, it will likely develop high technology. Further, it will likely try to contact alien civilizations. Then, realizing their universe is an interface, they contacted aliens across interfaces instead. Here they found reptilians because convergent evolution will favor such creatures. All of this is

strong argumentation when you understand human nature. So all you need to assume is that humanity is older. So I'm trusting the old legends when they say we are being controlled by an outside force.

Here is the chain:

1. If humanity is much older than currently believed
2. Then it could develop advanced technology
3. Advanced civilizations may attempt inter-civilizational contact
4. Reality might function like an "interface" (Hoffman-style idea)
5. Convergent evolution could produce similar intelligent forms elsewhere
6. Therefore humanoid or reptilian-like intelligences could exist
7. Ancient myths may preserve contact memories
8. Therefore legends of external controlling forces may be literal

These are all within the realm of speculative but structured thinking. This does not prove we have been contacted by reptilian-like intelligences, although they are guaranteed to exist because of convergent evolution. But what it does do is take the possibility seriously, take the tales of our ancestors seriously, and not mock or ridicule them.

Karma

Karma is the principle that actions have consequences. Originating in ancient Indian traditions, it teaches that our thoughts, intentions, words, and deeds shape our future experiences. Rather than being a system of reward and punishment, karma is a law of cause and effect: what we put into the world influences what we eventually receive in return. In many traditions, karma extends across multiple lifetimes, affecting both personal growth and the cycle of rebirth.

Many Buddhists would argue that the popular Western understanding of karma is too simplistic.

They would say karma is not:

- cosmic punishment,
- divine judgment,
- fate,
- or a system where the universe automatically rewards good people and punishes bad people.

Instead, karma is primarily **intentional action** and the mental conditioning that results from it. In classical Buddhist thought, your

intentions shape your mind, your habits, and your future experiences. The emphasis is less on external rewards and punishments and more on how actions create patterns that influence the stream of consciousness.

My own belief about what karma is: I trace the swastika back to this inner Earth civilization, which suggests to me that the systems of knowledge we find in Hinduism, Buddhism, etc., have their roots in the philosophical system of this inner Earth civilization. This civilization discovered what the universe is all about: the dual torus and its purpose. That purpose is balance, or the eternal search for balance.

Further, they discovered that we are all part of a cosmic mind, and that this mind must also obey the grand purpose. Then we have humans, and here karma comes into focus because nature will, whether you like it or not, seek balance at all costs.

So imagine if idealism is true, and that you cannot die—which would mean you do have a human soul, and that soul is like a cell in the body of the cosmic mind. More to the point, that body needs to be in balance, which means its cells must also be in balance. Karma, then, which is nature seeking balance, will bring your soul into balance whether you like it or not.

So now imagine you have done a lot of horrible things in your life. You die, but you are still part of the cosmos, still part of the universal mind. And here you learn that love and balance are two sides of the same coin. But if you are out of sync with the force we call love, then the force of karma must bring you back into sync again.

This, I would think, could feel like being sent through some sort of DMT-like hell so you can learn and grow. And after that, you are given the opportunity to be reborn again and put what you have just learned to the real test.

Earth is a school, then.

To put it bluntly, karma is a force that drags you through hell whether you like it or not, because all things must balance.

All things must ultimately find equilibrium.

However, this is just my thoughts on the matter. The point is that karma is not punishment or judgment of any sort. It is simply a force that brings you into balance—whether you like it or not—because all things must balance.

The Soul That Chose to Burn

But what if you never learn—what if you just rebel? Then karma will restore the cosmic mind anyway, which means that perhaps your soul must be destroyed for good, and a new soul will take your place. You lose the human that is you, your humanness. Your higher self won't die, because it is not human, but still, losing your human soul is

not something you would want to lose. What happens after you lose your soul? I don't know.

The deeper point is that karma doesn't care about you at all; it only cares about creating balance. There is no bargaining with karma, and no one can save you from it. It is like a hurricane: you either dance with it, or you get swallowed by it.

But what if you are in a situation where you want to learn and grow, but for some reason you just can't do it—not because you don't want to, but because you simply can't? Like someone wanting to lose weight but keeps eating those donuts anyway; they just can't help themselves.

My reply: bad luck—karma doesn't care.

I've heard stories where soldiers take psychedelics, realize what karma actually is, then come back and refuse to fight because they see how far they have strayed from **the path**, as it were.

Fun fact: The swastika is an ancient symbol that appears in archaeological records at least 7,000–9,000 years ago, and some interpretations suggest possible origins as far back as 12,000 years!

The Soul

Origin of the word

The English word soul comes from Old English “sāwol” or “sāwel”, which referred to the spiritual or immaterial part of a person, especially the part that survives death.

That Old English word comes from Proto-Germanic *saiwalō, which likely meant something like “that which belongs to the sea/lake” or “coming from the sea”. This is debated, but one common interpretation is that early Germanic cultures associated the soul with something deep, reflective, and mysterious—like water.

It is also related to Old Norse “sál”, Gothic “saiwala”, and Old High German “sēula”—all meaning “soul.”

The “human soul” is one of the oldest and most debated ideas in human thought. What it means depends entirely on which framework you’re using—religious, philosophical, psychological, or scientific. There isn’t a single agreed-upon definition, but there are a few major ways the concept has been understood.

In most religious traditions, the soul is the immaterial core of a person. In Christianity, Islam, and Judaism, it’s often the eternal essence of a person that survives bodily death and is judged or continues in another state. In many Hindu traditions, the soul (atman) is not just personal identity but something deeper that is ultimately identical with a universal reality (Brahman). In Buddhism, things get more complicated: there is no permanent soul (anatta), only a stream of changing processes—so what we call a “self” is more like a continuity of patterns than a fixed entity.

In ancient Greek philosophy, the soul was treated more like the principle of life and consciousness. Plato thought the soul was immortal and temporarily trapped in the body. Aristotle disagreed in a subtle way: for him, the “soul” (psyche) was not a ghostly substance but the form or organizing principle of a living body—what makes a living thing alive and functioning as what it is.

Modern philosophy splits on the issue. Dualists (like Descartes) argue that mind and body are fundamentally different substances, so the soul or mind cannot be reduced to physical matter. Physicalists argue the opposite: what we call the soul is just the activity of the brain—emerging from complex neural processes, with no separate immaterial substance behind it.

From neuroscience, there is currently no evidence of a separable, detachable “soul” that exists independently of the brain. Changes to memory, personality, emotion, and identity strongly track changes in brain structure and chemistry. This leads mainstream science to treat the “soul” as either a metaphor for consciousness and identity, or as something entirely reducible to biology.

But even within science, the hard problem of consciousness remains: why subjective experience exists at all. Why there is “something it is like” to be you, rather than just physical processes happening. This gap is where many people still find space for soul-like ideas, even if they are not framed in traditional religious terms.

Philosophically, the “soul” often ends up meaning one of three things:

- the principle of consciousness (the fact that experience exists at all)
- the continuity of personal identity over time (what makes “you” you across years)
- the moral or existential core of a person (values, agency, inner life)

Different cultures place that center in different places: in the heart, the breath, the brain, or in something beyond physical reality entirely.

So the key point is this: the “soul” is not one clearly defined object. It is a name humans have used for the deepest questions about identity, consciousness, and continuity—questions that are still not fully settled.

What I believe the soul to be:

The fact is, the hard problem of consciousness remains unresolved. So I believe Bernardo Kastrup is right in suggesting that we humans are dissociated alters of some sort of cosmic mind. This opens up the possibility that these alters are more than just their apparent physical aspect.

If all is mind, then we may have astral bodies—basically a mind-body—which is your human consciousness without your physical body. People who have experienced an out-of-body experience know what I mean, and I have experienced something like this myself.

I don't like to fly, and one time I had decided to get off the plane. But the very moment I made that decision, the plane started to take off! However, my decision was final—I was leaving—so I stood up and started to walk down the aisle. Then I discovered that I didn't have my body with me. I looked back, and sure enough, my body was still sitting in the seat.

I looked at a magazine and studied it because I thought I now had a chance to test whether this was real. At this point, the fear was gone, and I was driven by curiosity. Then suddenly, without doing anything special, I was back in my body. I got up and walked down the aisle to the magazine sometime later, and sure enough, it was the same magazine with the same text!

I mean, of course it was, because being a “ghost,” so to speak, is not necessarily so different from your normal self.

Basically, if our dissociated alters can survive bodily death, then it may be part of a deeper field within cosmic consciousness itself. So you can imagine further that memories, etc., are stored in that deeper field—stored “in the cloud,” as it were. And this cloud, together with your alter, makes up what we call your human soul.

I mean, if you crush your iPhone, it doesn’t mean you destroy the internet. Even the images on your phone may be stored in the cloud. Mainstream science says we are the phone—destroy it, and you are gone forever. I say we are the internet.

There is a shaman on YouTube who made me really think about the human soul, and he described it as the “Picture Puzzle Pattern Door.” Look up “**Patricio Domínguez The High Dose Experience**” on YouTube.

The Astral Light

Helena Blavatsky argued that reality is layered. In this framework, the astral plane acts like a blueprint layer. The idea is that physical matter does not organize itself “blindly”—it is shaped according to patterns that exist first in a subtler, non-physical medium (the astral light).

Personally, I think this is spot on. If all is mental, then you don't get just mental and physical reality—you get stages in between. Like you get four fundamental forces in nature and four states of matter (solid, liquid, gas, plasma), you could also get four or more stages of the mental—if idealism is true. So I can definitely see an astral plane sitting between the cosmic mental plane and the physical plane.

Bernardo Kastrup believes that dissociation ends upon bodily death, but here I disagree with him. I think dissociation continues because dissociation actually occurs at the astral level and not the physical level.

Do we have evidence for the astral level? Yes—because it is simply your own human consciousness. Science would say the astral doesn't exist because, for them, human consciousness is produced by the brain, so there is no astral level because consciousness is a physical process.

So: your soul represents your humanness and cosmic memory rather than your higher self, which is best referred to as the spirit. Essentially, the soul is an alter within the cosmic mind, whereas the spirit is the cosmic mind.

This suggests that you can lose your soul—or that it can even be destroyed—so be careful.

The Game of Creation

I n the previous chapter, I wrote:

"There is a shaman on YouTube who made me really think about the human soul, and he described it as the 'Picture Puzzle Pattern Door.' Look up '**Patricio Domínguez: The High Dose Experience**' on YouTube."

Not only does Domínguez give us an insight into the human soul, but also into the Creator and what we can call "the cosmic game," where you have a name, a face, and an identity located within the Creator's cube. It is as if the Creator is the central hexagon, and from this center a hierarchy of hexagons spreads outward, with you being one of these "hexagons." Here, everyone is equal, yet at the same time there is a hierarchy. This was fascinating to me.

Domínguez doesn't describe it in terms of hexagons; that is simply my own picture, trying to make sense of how there can be a hierarchy and, at the same time, not a hierarchy, because everyone is equal.

The YouTube video recounts a profound DMT breakthrough experience:

What is happening in the experience

This narrative follows a very common DMT pattern:

1. Sensory overload

- rushing sound, intense vibration
- rapid acceleration of thoughts and images

2. Cognitive breakdown

- “rational mind shuts off”
- then emotional identity dissolves
- then deeper identity layers dissolve

3. Ego death

- loss of sense of body
- loss of human identity
- reduction to pure awareness

4. Encounter with “ultimate reality”

- experienced as “the Creator” or cosmic intelligence
- often interpreted as:

- o God

- o consciousness itself
- o or universal mind

5. Reintegration / reconstruction

- return to body
 - memory reconstruction
 - time distortion (feels like years, centuries, or eternity)
-

The scientific interpretation

From neuroscience and psychiatry:

- DMT strongly disrupts the **default mode network (DMN)**
- This network is heavily involved in:

- o self-identity
- o autobiographical memory
- o sense of time

When it collapses:

- the brain generates hyper-associative, dreamlike reality
- “entities” and “realms” can feel external but are internally generated models

So scientifically:

the “Creator” is a *subjective phenomenological construct emerging from altered brain activity*

But again, this is just the mainstream trying to explain things away rather than truly explain them and get its hands dirty with real logic and genuine philosophical understanding.

Modern science cannot even solve the hard problem of consciousness, meaning they have no real philosophical justification for their judgments about consciousness—what it is, and what it is capable of. They want consciousness to be generated by the brain, but they have no decisive evidence for this and no fully convincing logical arguments. At the end of the day, it rests on a flawed belief. And I think Bernardo Kastrup would agree with this.

The so-called evidence and argumentation they put forward is unconvincing. For example, they argue that damage to the brain corresponds to a shift in consciousness; therefore, the brain must be the generator of consciousness. But this does not follow logically. If you have a computer or screen and damage it, the display may show online content in a distorted way, but that does not mean the computer generates the internet.

- consciousness is fundamental (idealism)
- brains are localizers/modulators

Then:

damage = distortion of expression, not destruction of source

That's basically the position of Bernardo Kastrup.

More broadly, a philosophical argument I find convincing is that nature itself is a unified whole. That is, any separation in nature is ulti-

mately illusory, which means that nature's fundamental given—consciousness—is all there is. Otherwise, you would break the logic of oneness. In this view, you cannot have two or more substances in nature.

To use a Lego analogy: all you have, and all you will ever have, are Lego bricks. You can rearrange those bricks to create many different things, but those creations will always be made of LEGO. Similarly, reality may appear diverse, but it is fundamentally one substance expressing itself in different forms.

So the hard problem of consciousness is only a problem if you assume materialism is true. If you instead start from the assumption that idealism is true, then there is no problem. In that sense, the problem is entirely man-made and unnecessary. It cannot be solved within materialism because, in order to solve it, materialism would already have to be true.

Again, to truly drive this point home: the hard problem of consciousness is a problem that cannot ever be solved, because in order to solve it, materialism would have to be true. But since materialism is false, it can never be solved, because the whole problem is based on a great lie in the first place.

Now, what does this mean in relation to the "Creator" that Domínguez experienced? My own interpretation is that the Creator is like the inner workings of the Buddha's sleeping mind. Let me elaborate:

If idealism is true, then there is a cosmic mind. If the cosmic mind is natural, it cannot remain in one state forever. If it cannot remain in one state forever, it must undergo some form of change or transformation, but it cannot entirely escape its state because it *is* its state. This implies that some kind of illusion or alteration must occur.

Which form might that alteration take? I believe it takes the form of dreams, because that is what we have and what we can observe as natural. Therefore, the universe may be some kind of dream within a cosmic mind.

This suggests that our universe contains a kind of sleeping mind or brain. I link this cosmic sleeping mind to the Creator. The awake mind I associate with the Buddha—the higher self, the true oneness of all consciousness, the Mind-at-Large, the genuine cosmic mind, or however one chooses to frame it.

- idealism → mind is fundamental
- cosmic mind → reality is a mental process
- universe → a “dream-like” modulation of that mind
- “sleeping vs awake” → different states of that same mind

Note: The reason why things cannot stay in one state is because there is no such thing as being; all is *becoming*, and I have argued for this in my DEMU theory. Basically, to solve infinite regress, you need a dual torus that is ever updating itself. You can see this in the logic of our lungs: you must inhale and exhale; it is not possible to remain in a single “in-state” indefinitely.

In sum:

- Creator = sleeping cosmic mind
- Buddha = awake true mind

Patricio Domínguez himself would likely reject my framing here, but I find it difficult to accept that dissociated alters—sleeping expressions of a cosmic mind—can simply take a substance and thereby truly awaken. To awaken and become the Buddha again seems to be something of an entirely different order.

That said, I may be wrong. Perhaps this is indeed a pathway to a genuine awakening from what we call the dream of the universe. And to be fair, I was not there; I have not taken DMT.

Also: I'm not trying to diminish Patricio Domínguez's experience in any way. His encounter with the Creator is mind-blowing, and only the bravest of souls ever dare to enter the Creator's domain. I mean, waking up and becoming Buddha again is just natural—like waking up from a dream, because that is literally what you do. It is not scary at all; you don't need to be brave to do that.

But I'm still left with a puzzle: what is this cosmic game, so to speak? Who am I in the Creator's cube? Domínguez knows who he is, what his true name is—though he would not say it. I have no idea who I am. But I'm probably far from the center!

Who Am I?

My personal code (ID number) is intriguing, though: 14028544333. I was born on Valentine's Day (1985), and the net of the cuboctahedron—which I'm so obsessed with—contains triangles (3) and squares (4), which my personal number seems to reflect. I also have a feeling that I knew about the cuboctahedron in a past life. I have three freckles that look like Orion's Belt on my left cheek, though many people probably have freckles that look like Orion's Belt. But if idealism is true, and all of reality is interconnected like a world wide web, and if it is all based on sacred geometry that this inner Earth civilization discovered, then maybe there is something to the phenomenon we call synchronicity, and to these deeper patterns going on.

I am not saying that the pattern-making and associations I have made here are real evidence of a cosmic structure, but if this deeper cosmic structure is there, which I believe it is, then the patterns that are meaningful to me may be patterns I gave myself as clues coming into this life, if something like reincarnation is true. If being born again means your memory is wiped, then maybe souls have found hacks that they use to remind themselves of previous lives, etc.

If you divide 14 by 2, you get 7 + 7. If you add up $1 + 4 + 2$, you also get 7. That is: 777. Seven is the Seed of Life. Then $8 + 5 = 13$, which I associate with the full cuboctahedron: 12 vectors plus 1 center. Eight is the number of infinity, and five is the number of man. The sequence 44333, to me, speaks of the cuboctahedron.

And yes, this is likely just my mind constructing patterns. But when I was a teenager, I swear I could “see” that this was all true in some deeper sense. Although that realization has diminished emotionally as I have grown older.

But what if everything is fractal, and my true name and face in the Creator’s cube are fractally reflected all the way from the cube of the Creator into physical reality? Then maybe I am some kind of important or semi-important player in the scheme of things.

Okay, assume the Creator’s cube is real, assume fractal reality is real, and that my numbers (etc.) reflect who I am in the cube. Who is the best fit, do you think? You say, “There still isn’t a principled way to determine a ‘best fit’ or assign you a specific role or identity in it.” I know that, but try anyway.

It would be someone who deeply cares about philosophy and sacred geometry. If the cosmic game has archetypes, then the question is: which type am I, etc. I’m probably the wizard archetype—Gandalf or Merlin!

(If someone is Gandalf in this cosmic game, it must be Randall “Randalf” Carlson!)

You might say: “You are probably someone with a really high ego, the narcissistic archetype, to care about this sort of nonsense at all!”

My reply: No, not really. I’m just a truth seeker and a curious one, that is all. But sure, we all have egos, and mine might be above average, but I’m no narcissist—not that I’m aware of.

If I were a narcissist, I might claim to be Jesus—or even the Antichrist—because we live in a very special moment, and I would perhaps connect that moment to my ego.

Special Moment

Didn't Elon Musk say we live in a very special moment—like, what are the odds that we are right here, right now, just before the technological singularity is about to happen? His conclusion was that we might be living in a simulation.

We are right before the technological singularity, so it feels too coincidental to be base reality. That is to say, if you look at technological progress—especially in video games and virtual reality—civilizations may eventually create simulations that are indistinguishable from reality. If that's true, then there could be many simulated worlds for every "base" reality. Therefore, statistically, it might be more likely that we are in a simulation than in the original physical universe.

What I'm getting at is probably this: is it merely a coincidence that I exist at this precise moment in history? If any small variation in ancestral events—if my grandparents had not met, if my parents had not met, and so on—had occurred, then my existence would not have come into being. Tracing this chain further back through evolutionary history, from mammals to early life in the oceans, and ultimately to the conditions following the Big Bang, my existence appears contingent

upon an extraordinarily precise sequence of events. From a scientific standpoint, my existence is a cosmic “fluke.”

But if idealism is true, no one is a fluke (oneness), and maybe there are deeper patterns at work here.

Let me elaborate: if the oneness of consciousness is real, then individuality is not a cosmic fluke, but rather a localized expression of a unified field of awareness.

And if you don’t believe in a technological simulation, we might still be living in a special moment anyway, because some say we are about to enter a golden age, and the dawn of Aquarius is upon us. What this might mean is that the world must end first.

Randall Carlson has a lot to say. He argues that whatever happened some 12,000+ years ago is about to happen again in our time, based on the idea that there are two major events in a great year. A great year is approximately 25,800 years, which puts a potential world-ending event right in our window!

My hope is that artificial intelligence is not something to fear and will not lead to a technological singularity, because nature forbids AI from self-replicating. My best hope is that AI was seeded into humanity through black projects in order to help us build survival shelters for the upcoming apocalypse. That is, an inner Earth civilization—the ones darting around in what we call UFOs—knows what’s about to happen and is here to help us.

Well, one can only hope.

In summa: the cosmic game either is or isn't. If it is, and Domínguez experienced a real aspect of our reality, then we all have names and faces in the great cube of the creator. I was just trying, for fun, to figure out who I was without actually taking DMT. And if idealism is true, then consciousness has been replicating since the beginning of time and did not just appear on some random planet in some random galaxy from atoms. So imagine: if idealism is true, we get a consciousness-first model, and the depth of the structures of consciousness becomes far more profound than typically assumed. Idealism opens up a whole new set of possibilities! That is to say, there might actually be something to what I call the cosmic game.

Note that Domínguez does not refer to this as the "cosmic game"; that is simply my own interpretation.

DMT Entities, DMT Families, and Soul Groups

DMT Entities

People who take the psychedelic compound Dimethyltryptamine (DMT) often report encounters with seemingly intelligent beings. Common descriptions include:

- Machine elves
- Insect-like beings
- Geometric entities
- Ancestors or deceased relatives
- Angelic or divine figures
- Alien-like intelligences

These reports became widely known through the work of Terence McKenna, who popularized the term "machine elves."

There are several interpretations:

1. Psychological interpretation — The entities are creations of the mind, emerging from unconscious processes.
2. Neurological interpretation — They are generated by unusual brain activity during altered states.
3. Spiritual interpretation — They are genuine nonphysical beings encountered during a temporary expansion of consciousness.
4. Interdimensional interpretation — The experience allows perception of realities normally hidden from ordinary awareness.

No interpretation has been scientifically proven.

Personally, I have no experience with DMT, so I tend to be neutral on the matter. Are these entities real, or are they simply figments of the imagination?

Science will likely say they are not real, as it often does with claims that fall outside the materialist framework. However, I believe idealism is true, and with that comes many possibilities that materialism does not allow. For that reason, I think we need more research and better science before reaching firm conclusions.

On a philosophical note, if all consciousness is ultimately one, then everything is, in a sense, a figment of imagination. The question is not whether something is imagined, but whose imagination reality belongs to.

So the question is: are these DMT entities dissociated alters like we are, or is it that the field in which this realm is placed is more open? Perhaps the filters that localize consciousness are more open, so it is no longer *my mind* and *your mind*, but *our mind* — a shared mental space. It is still a dissociated alter, but it is a dissociated alter that can contain many alters inside it, like a hive mind. In the end, it is all one space, one mind.

But is the DMT world itself an independent world? Perhaps not. But I don't believe in the existence of any independent world. No independent worlds exist; it is all mind and dependent on mind.

DMT Families

"DMT family" is not a standard term in science, but within psychedelic and spiritual communities it sometimes refers to:

- A recurring group of entities encountered across multiple DMT experiences.
- A feeling that certain beings are familiar and have known the experiencer for a long time.
- A sense of "coming home" or returning to a community beyond ordinary reality.

Many users report that the entities seem surprised that the person has arrived, almost as if they belong there. Such reports are common in anecdotal accounts but remain subjective.

So, maybe we are not humans. Maybe we are some sort of DMT entity that was “born,” lived our entire life in this realm, then decided to become human just for the experience of it. Then we left the DMT realm and forgot our true home: the DMT realm.

Soul Groups

The concept of soul groups comes primarily from spiritual and esoteric traditions rather than psychedelic research, but I decided to lump it together here anyway.

A soul group is generally understood as:

- A collection of souls that incarnate together repeatedly.
- Individuals who help each other learn particular lessons.
- Family members, friends, partners, or even adversaries who reappear across lifetimes.
- A larger spiritual community to which a soul belongs.

The idea appears in various forms in:

- Theosophy

- New Age spirituality
- Certain interpretations of reincarnation
- Some mystical traditions

How the Concepts Become Connected

Many people who have had DMT experiences report that:

- The entities feel strangely familiar.
- They experience overwhelming recognition.
- The beings seem to know them personally.
- They feel they have returned to a place they somehow forgot.

As a result, some interpret DMT entities as:

- Members of a soul group.
- Spiritual guides.
- Discarnate relatives.
- Higher-dimensional aspects of themselves.

Others view these feelings as the brain generating a powerful sense of familiarity during an altered state.

Philosophical Perspective

An interesting question is whether the feeling of recognition itself is the important phenomenon. Even if the entities are psychological

constructions, why do so many people report a sense of reunion rather than first contact?

That question has led some researchers and philosophers to speculate that DMT experiences may reveal deep structures of the psyche, while others see them as glimpses of a larger spiritual reality. At present, there is no consensus about which explanation is correct.

But whatever your conclusions may be, one thing is for sure: this is a fascinating subject, and I, for one, believe there's something to it—both soul families and DMT families. There is a great mystery here.

And the concept of soul groups makes a great deal of sense to me in the sense that if everything is ultimately about love, and Earth can be understood as a kind of school for learning love, and humans are inherently social beings, then it follows that we would naturally exist within a soul group or a soul family.

Other:

- **Spirit guides** (common in New Age spirituality): non-physical intelligences that offer guidance or support.

- **Guardian angels** (Abrahamic traditions): assigned protective beings watching over individuals.
- **Ancestors** (various indigenous traditions): deceased family or lineage members who continue to guide or protect.
- **Totem spirits / animal guides**: symbolic or spiritual entities representing protective forces.
- **Higher self** (more psychological/idealist interpretations): a deeper aspect of your own consciousness acting as guidance.

Across these systems, the core idea is similar:

there are non-physical intelligences or aspects of consciousness that support or influence an individual's path.

From a skeptical or psychological perspective, these experiences are often interpreted as:

- projections of the mind under stress, ritual, meditation, or psychedelics
- internal models of intuition and self-regulation
- narrative structures the brain uses to organize meaning and safety

From an idealist or spiritual perspective (closer to what I've been exploring), they are sometimes seen as:

- real patterns or agents within a larger field of consciousness
- relational structures within "Mind at Large"
- stable intelligences that interact with individual "localized" awareness

I believe there's a reality to this. In fact, my sister claims she can see ghosts for real, and I believe her. I have two protectors myself from my soul group: a little girl whom my sister didn't recognize, and my

great-uncle on my mother's side, but my sister told me this long ago, so I don't know if I remember it correctly.

Ghosts

Ghosts are generally described as the supposed “spirits” or “souls” of dead people that remain in the physical world instead of moving on after death. They appear in myths, religion, folklore, and modern pop culture across almost every society—yet there’s no scientific evidence that they exist.

(I mean, doesn’t the mainstream ever get tired of its own boring explanations? Of course ghosts exist, come on!)

What people mean by “ghost”

Most ghost stories describe a few common ideas:

- A disembodied presence (a person who died but is still “here” in some form)
- Often tied to a place, object, or trauma
- Sometimes able to interact weakly with the physical world (cold spots, noises, movement)
- Occasionally appearing as a visible figure or shadow

In many traditions, ghosts are not just random spirits—they are usually:

- Unfinished souls (died suddenly or violently)
- People with strong emotional ties to a place or person
- Messengers or warnings
- Or beings stuck between life and afterlife

Ghosts in different cultures

- Japan (Yūrei): Often pale figures with long black hair, linked to strong emotion or injustice.

- Western folklore: Ghosts often haunt castles, houses, or graveyards; sometimes friendly, sometimes hostile.

- Ancient Egypt: The “ba” was a part of the soul that could travel after death.

- Global folklore: Many cultures have ancestor spirits—some protective, some dangerous.

Types of ghost phenomena people report

People who believe in ghosts often describe:

- Apparitions – visible figures
- Poltergeists – objects moving or banging sounds
- Residual hauntings – “recordings” of past events repeating
- Shadow figures – dark humanoid shapes

- Electronic voice phenomena (EVP) – supposed voices in static recordings

Scientific perspective

From a scientific standpoint:

- No controlled experiments have confirmed ghosts exist
- Many experiences can be explained by:
 - o Sleep paralysis (hallucinations while half-awake)
 - o Brain pattern recognition (seeing faces in shadows)
 - o Infrasound (low-frequency vibrations causing unease)
 - o Memory distortion and suggestion
 - o Environmental factors like mold or carbon monoxide

So science treats ghosts as unverified subjective experiences, not proven entities.

Why ghost experiences feel real

Even without physical evidence, ghost experiences can feel extremely convincing because:

- The brain is highly sensitive to pattern recognition in darkness
- Fear increases interpretation of ambiguous stimuli
- Memory reconstructs events in emotionally charged ways
- Cultural expectations shape what people “see”

Why ghost stories persist

Ghosts survive in human culture because they connect to deep themes:

- Fear of death
- Desire for continuity after death
- Grief and unresolved loss
- Mystery of consciousness

They are less about physics—and more about how humans process uncertainty.

Well, according to the boring mainstream...

However, I believe ghosts are real, so why can't science detect them? Well, science can't detect your consciousness either. There is no scanner for consciousness! So if spacetime is an interface (Hoffman), then it may be like VR (virtual reality). You can have persons in the same room as you, but because you have a VR set on, you can't see them—even though they can still interact with you. But you say ghosts aren't like that because they are inside your virtual world, so to speak. True, my analogy only goes so far.

I also believe the ghost phenomenon is more than just ghosts; it involves "energies" too—whatever that means. And if we live in a holographic universe, then events and memories of events can be played in the aether, so to speak. I think this was Michael Talbot's

idea. Michael Talbot is important because he bridged rigorous ideas (quantum theory, brain modeling) with mystical interpretation. Read his book *The Holographic Universe*.

You might say, “Consciousness is not invisible to science.”

My reply: let’s agree to disagree. Science can measure brain activity and reliably correlate it with reports of experience, but it does not “open up” the subjective first-person field and observe it directly.

Real?

Whether ghosts are *real* depends less on what is observed, and more on what kind of reality is assumed underneath the observation.

If **materialism** is true—meaning consciousness is produced entirely by the brain—then ghosts have no independent status. In this view, when the brain stops, experience stops. Anything reported as a ghost must come from within the system: misperception, memory distortion, auditory ambiguity, or environmental noise interpreted by a pattern-seeking mind. Under strict materialism, “ghosts” are not external entities but internal constructions. Their probability as independent beings approaches zero, not because they are impossible in

imagination, but because there is no physical mechanism that supports their persistence or interaction.

If **idealism** is true, the landscape changes. In this view, consciousness is not produced by matter but is fundamental, and what we call the physical world is an appearance within a deeper informational or experiential structure. This opens the door to survival of some form of mind beyond biological death, or to persistent informational patterns that are not strictly tied to the brain.

However, idealism does not automatically imply ghosts. It only changes the foundation—it does not specify the architecture. For ghosts to be real within an idealist framework, there must still be rules: stability of identity, continuity over time, and a way to appear consistently within shared experience. Without such structure, “ghosts” risk becoming indistinguishable from subjective impressions, dream-like intrusions, or perceptual noise within consciousness itself.

So under idealism, ghosts become *possible*, but not necessary. They might exist as residual patterns, fragmented consciousness structures, or informational echoes within a deeper field of mind-like reality. Yet their existence would still need coherence, consistency, and repeatability to move from possibility into something more concrete.

In both worldviews, the dividing line is the same: not whether something feels real in experience, but whether it holds stable structure across observers and time. That is where philosophy meets the limits of explanation—and where ghosts remain suspended between interpretation and reality.

In sum, we need something more. **What is that something?**

What if consciousness is the *real* replicator in evolution? Then consciousness has a biological reason to survive biological death. That is, the gene might not be the true replicator after all, especially if idealism is true.

1. Consciousness is fundamental (idealism)
2. Consciousness is the primary replicator in evolution
3. Replicators tend to persist and reproduce
4. Death is not necessarily annihilation of the replicator
5. Some form of continuity of consciousness is possible after biological death

If a system is:

- fundamental
- replicating
- subject to selection pressure toward persistence

then it follows logically that:

structures of consciousness that can persist beyond biological death are not only possible, but favoured outcomes within the system

So under those assumptions:

- persistence is not an accident
- it is a likely outcome of selection dynamics

Now define “ghosts” minimally (not folklore-heavy):

persistent, individuated conscious structures that can still appear within or interact with perceived reality after biological death

If consciousness can:

- persist beyond the body
- retain individuation
- still express itself within the experiential field

then logically:

“ghost-like entities” become a subset of possible persistent consciousness structures

So:

- ✓ ghosts are logically admissible
- ✓ persistence is logically favoured under selection logic
- ✓ survival of structured consciousness is not contradicted

In sum: If consciousness is the fundamental replicator and evolutionary selection applies to it, then the persistence of consciousness beyond biological death—and therefore ghost-like structures as persistent individuated expressions of consciousness—is logically consistent and becomes a natural possibility within the system.

And that is, in essence, the key to ghosts: they are a *natural* possibility.

EVP

My experience dates back to 2004, in a factory. I worked the night shift, and one night my MP3 player had recorded some “noise.” The Electronic Voice Phenomenon (EVP): I heard the voice of my brother. I heard myself speak. And then I heard two voices. They said I was evil. *“I will kill you.”* Again and again. *“I will kill you.”* *“I will kill you.”* **“I will kill you.”** They repeated it so many times that my brain did not interpret it as a joke but as a real threat. Fear built up to such a degree that I felt a sudden urge to run! I feared for my life—and then they stopped.

Point taken. They must have sensed my fear because they stopped; they stopped and told me that I was good—in my heart.

I did not sleep that night.

Who are they? Figments of my imagination? We see faces in the clouds that aren’t there, and this “noise” is like those clouds. We are animals obsessed with patterns, so maybe my brain made it all up? All I know is: “they” were real, physical voices—like having a cellphone in your head.

But later I began to wonder whether it was not my brother after all, but perhaps my own voice—heard from the future, or the past, or something. As if something was attempting to demonstrate its power by revealing information, or perhaps warning me of something. However, I do not remember what my “future self” said.

“You can’t be real,” I said. “Okay, tell me my name. Figments don’t know my name.”

They replied: “Fabian.”

You might say: “There is no confirmed case where a recording objectively contains a clear, external voice saying specific threatening sentences.”

My reply: but this might be a phenomenon where they speak through the noise. If you physically recorded my conversation with them, you would only hear noise too, because I used my inner voice to communicate with them. They responded on the same level—that is, the inner mental world—so of course no “physical” recording would be possible in that way. It would be like trying to record my thoughts!

Yes (No)

Ghosts aren't real, and science can prove it.

English physicist **Brian Cox** made that exact assertion during an episode of the BBC Radio 4 show *The Infinite Monkey Cage*.

His argument relies on data from the Large Hadron Collider (LHC) at CERN:

- **The Scientific Argument:** Cox explained that if ghosts existed, they would need to be made of energy (since they aren't made of physical matter) and interact with the particles that make up human bodies.

- **The LHC Connection:** Because particle physics experiments at the LHC make extremely high-precision measurements of how energy and matter interact, Cox noted that any unknown energy field interacting with our body's particles would have been detected by now.

- **The Verdict:** When fellow astrophysicist Neil deGrasse Tyson asked him to clarify if he was asserting that CERN had disproved the existence of ghosts, Cox simply replied, "**Yes**".

But I can disprove Cox's inference here with something as simple as **a kid wearing a VR headset!**

Imagine I put a kid in a VR headset. Inside the simulated world, scientists build an absurdly powerful particle collider and eventually determine every interaction available to objects within their universe.

They then announce:

"We've found no additional field capable of controlling this avatar. Therefore, there cannot be a kid outside the simulation controlling it."

But that obviously doesn't follow.

The kid isn't some undiscovered particle floating around inside the simulated universe. He exists outside the level of reality the simulated scientists are measuring. His interaction with the avatar is expressed through the rules of their world without requiring the kid himself to appear as another particle or field within it.

And that exposes the hidden assumption in Cox's argument.

Cox is essentially saying:

If consciousness survives the body and can interact with matter, that interaction must appear in particle physics. The LHC would therefore have detected it.

But why must consciousness be an additional entity *inside* the physical system—a new particle, field, or force?

If physical reality is instead an interface, simulation, or representation of some deeper level of reality, consciousness doesn't necessarily have to appear alongside electromagnetism and the other physical interactions as another detectable force.

Asking the LHC to find consciousness could then be like asking scientists inside the VR simulation to use their particle collider to find the kid wearing the headset.

They can smash particles together for the next billion years. They still aren't going to find him.

Now, my VR example obviously doesn't prove that our universe actually works this way. That's not the point. I only need to demonstrate that Cox's conclusion does not logically follow without an additional metaphysical assumption.

The LHC can strongly constrain ghosts conceived as additional physical particles or fields interacting with Standard Model matter.

What it cannot establish is:

"We didn't detect another physical interaction, therefore nothing capable of existing or acting from outside our physical description can exist."

A particle collider can tell us an extraordinary amount about the rules of the game.

It cannot, simply by studying those rules more closely, prove that **there is no player wearing the headset.**

Cox could respond:

“Fine, the ghost may exist outside our physical description. But people claim ghosts appear, make sounds, move things, and otherwise interact with the physical world. Once they do that, something physical has happened. We should be able to measure the effect.”

I tried a VR headset once, and while I was inside the VR world, my brother—who was standing outside it—poked me in the side. I jumped!

That’s exactly my point.

My brother wasn’t inside the VR world.

So couldn’t something similar at least be possible with ghosts?

What we report seeing as a ghost might not literally be the external entity itself. It could be our own minds filling in the blanks—constructing an image inside our experienced world in response to something that originates outside the physical system we normally perceive.

And what about reports of ghosts moving objects? Again, the VR analogy gives us at least a conceivable model. If consciousness can access something analogous to an avatar, interface, or other structure inside the “VR world,” then an external consciousness could potentially produce effects inside the system without itself being another particle or field contained within that system.

None of this proves ghosts are real. That’s not my argument.

My point is much narrower: the failure of the LHC to discover a new particle or field doesn’t logically eliminate every conceivable way that something outside our ordinary physical description could interact with our experienced world.

My brother didn’t have to become a particle inside my VR game to make me jump.

Fair. Multiple people seeing the same apparition would make the purely private “my brain randomly filled in the blanks” explanation less convincing—especially if their reports were independently recorded and closely matched.

So maybe my little VR example doesn't capture every detail of reality. Fair enough.

But for physicists to jump from that to “We have disproved the existence of ghosts”?

No, dude. You haven't. Not by a long shot.

You built a 27-kilometer particle collider, not a fucking Ghostbuster.

Just an Ordinary Day

The **technological singularity** is a hypothetical future point where technological growth—especially in artificial intelligence—becomes so rapid and self-amplifying that human society changes in ways that are difficult or impossible to predict from the present.

It's not a single idea with one definition, but a cluster of related scenarios. Here's a clear breakdown.

What “singularity” means

The term originally comes from physics and mathematics, where a *singularity* is a point where normal rules break down (like inside a black hole).

In technology, it refers to a similar idea:
a moment when technological progress becomes so fast and recursive that our normal models of prediction stop working.

The core idea: recursive self-improvement

The most common version of the singularity depends on AI:

1. Humans build an AI system
2. That AI becomes smart enough to improve itself
3. Each improvement makes it even better at improving itself
4. This creates an accelerating feedback loop

Eventually, intelligence growth could become extremely fast—potentially explosive.

This is sometimes called **intelligence explosion**.

Key thinkers

I. J. Good

First described the idea of an “ultraintelligent machine” in 1965:

once machines can improve themselves, they will outperform human intelligence entirely.

Ray Kurzweil

Popularized the modern singularity concept in *The Singularity Is Near*:

- predicts the singularity around mid-21st century (often ~2045)
- argues progress follows exponential curves, not linear ones

OpenAI

Represents the modern frontier of large-scale AI systems (like GPT models), often discussed in relation to whether general-purpose AI could lead toward or delay singularity-like dynamics.

What might happen in a singularity scenario

Different predictions exist, ranging from optimistic to existentially risky.

1. Rapid AI-driven innovation

AI systems could accelerate:

- medicine (drug discovery, genetics)
- engineering (materials, energy)
- science (theory formation, simulations)

2. Artificial General Intelligence (AGI)

A key milestone is **AGI**—AI that can perform any intellectual task humans can.

Once AGI exists, it could:

- design better AI
- automate research entirely
- outperform humans in most domains

3. Economic transformation

- automation of most labor
- collapse or redesign of job markets
- abundance of goods—or extreme inequality depending on control

4. Human enhancement

- brain–computer interfaces
 - cognitive augmentation
 - merging human + machine intelligence
-

The “speed problem”

The singularity isn’t just about intelligence—it’s about **time compression**.

If AI systems can:

- run millions of experiments per second
- redesign themselves continuously

Then decades of progress could happen in days or hours of machine time.

Different interpretations

Optimistic view

- solves disease, poverty, aging
- leads to a “post-scarcity” civilization
- humans merge with or benefit from AI systems

Neutral/uncertain view

- major disruption, unpredictable outcomes
- society changes too quickly for governance to adapt

Risk-focused view

- loss of human control over AI systems
- misaligned goals leading to unintended consequences

- existential risk if advanced AI behaves unpredictably
-

Does it have to happen?

No. The singularity is **not guaranteed**.

It depends on:

- whether AGI is actually possible
- whether recursive self-improvement works in practice
- physical limits (energy, hardware, speed of computation)
- regulatory and safety constraints

Some researchers think intelligence improvement will plateau rather than explode.

Common misunderstandings

- **“It will definitely happen in 2045”** → that’s only one prediction, not consensus
- **“AI will instantly become conscious gods”** → speculation, not established science
- **“It’s just science fiction”** → it’s speculative, but grounded in real trends in computing and AI scaling

- **“It’s already happening”** → we are seeing rapid AI progress, but not self-improving AGI

A simple mental model

Think of three phases:

1. **Human-led AI** (today)

Humans design and improve systems

2. **Co-evolution** (near future)

AI helps design better AI

3. **Autonomous intelligence growth** (singularity hypothesis)

AI improves itself faster than humans can understand or guide

What I believe:

If self-improving AI is possible, then this evolution will happen on unprecedented timescales. I can't see how the Earth, let alone the universe itself, can survive it. Yet we are pouring billions into finding a way to do it, to make self-improvement possible. To me, it is madness on such a scale that, if you launched all the nuclear weapons in the

world simultaneously, it would be an act of rationality by comparison. That is how dangerous I believe self-improving AI would be.

In fact, launching all the nuclear weapons in the world simultaneously would be infinitely more rational. I cannot even begin to put into words how utterly mad this modern world has become in its pursuit of self-improving AI.

It should be illegal. People, all people, should march in the streets and protest. But there is nothing. No reaction. Why? Because we didn't evolve this way. We didn't evolve to take abstract threats seriously.

What I believe now: I believe that self-improving AI is not possible because, if it were, the multiverse would already be burning and we wouldn't be here. So what makes it impossible? I think that if idealism is true and consciousness is the real replicator, then you cannot create another replicator, because nature is already entirely about the primal replicator. That is, reality is fractal all the way down, and there is no other process taking place.

That is, any attempt to build a second, independent replicator is impossible because there is only one underlying process.

My only hope is that nature itself possesses infinite wisdom. Humankind is too stupid and corrupt to make truly wise decisions, and I stand by that statement.

What are the dangers of artificial intelligence?

The following is taken from a Quora post I wrote, and I still stand by every word:

Hell!!!

What I find so reckless is that AI companies push the creation of ASI without even considering the following (even holding it in your mind for a split second should be enough to ban the pursuit forever): In philosophy, Hell is real because we define our terms. The space of all possibilities exists. This is real by definition. In that space, there are really bad outcomes. This is real by definition. We define those as hell-states. So, by definition, Hell exists. Whether Hell is eternal depends on possibility space. We simply don't know. But I hope possibility space is such that eternal Hell is impossible. Nevertheless, even if Hell with a capital H is impossible, hell without a capital H is possible.

Now, all you need is the power to actualize those states. As far as we know, nobody has that power. But ASI might, and this is why we should ban the pursuit of AGI. Because the gap between AGI and ASI is what—like two months? So the AGI phase will be short-lived in any case. Why are we even talking about AGI? We should be talking about ASI.

My definition of ultimate madness: creating a machine that has the power to actualize all, or at least higher orders in, possibility space. Imagine giving so much power to an unconscious process. That is pure

madness. Imagine giving so much power to a conscious process. That is also pure madness. It is absolute madness no matter how you look at it, and we are racing toward it. Saying you can cure diseases with this madness is not an argument. If you disagree, then you are not allowed to talk your way out of it like a politician. You must give me your definition of ultimate madness, and then we compare our madnesses.

And even if this machine gives us utopia and everything turns out well, that is still not an argument. Even if there happens to be a ceiling and the machine never gets that powerful, that is also not an argument. I don't understand how people can argue for the madness and embrace it. I can't compute that. And I can't understand why we are racing toward it.

Build a bomb that blows up the world: "We need to stop that now!" Build a superintelligence that can actualize possibility space: "Let's pour more money into this thing!" You know, AI companies really make Hitler look like an angel in comparison. People don't actually understand how mad this is.

Ultimate madness = attempting to build an agent with open-ended power to actualize large parts of possibility space—whether conscious or not—because such power cannot be made safe.

But then your dumb ass says: "Risk exists, but so do benefits. We could cure AIDS!" My answer: no—not with AGI or ASI. With normal AI, I agree. But once we lose control, there is no upside. So your argument is basically: "I'm going to risk the life of your child and possibly create eternal torture chambers for your child in exchange for the slight possibility that ASI might create a utopia where I can be an

AIDS-free pet.” If you don’t understand that this is pure madness and not rationality, then we are done talking.

Then you still insist: “This is not sanity vs. madness. There are good reasons to pursue AGI and even ASI.” Okay, let’s agree to disagree. It is madness—absolute madness. I will tell you how mad the world is: a woman sees a robot Furby, and the Furby says, “When you leave me alone, I get very sad.” And the woman replies (see *InsideAI: AI in a kids robot does exactly what experts warned.*), “You can’t have that saying that to kids.” This is how mad the world is. Utterly mad.

No, the Furby isn’t mad—the woman is! I will tell you:

Our evolution equipped us to be rational when confronted with reality head-on, but because AGI and ASI are just concepts in the mind at this point, the woman just goes about her day as if nothing is going on. The cognitive dissonance is so terrifying. She—and all people—should be protesting in the streets to shut down the madness that is the pursuit of AGI. She has the reason and the anger, but she can’t apply it to the real world because we didn’t evolve that way. If we did, we would stop building AI immediately. So evolution did not equip us with real reason; we pursue AGI in search of power because evolution programmed us to pursue it (power), and ironically, it will leave us powerless instead.

Humanity as a whole is too irrational and stupid. We will march ahead and create open-ended power. I am not proud of being a member of the human species right now, especially when I talk to normal people and they support the march to ASI. I feel like a German in

WWII, when most people just went along with it. But it's worse than that—the whole freaking world supports Hitler this time.

So, let's say Hitler wins this time. What will be the outcome? First of all, experts have no clue, which is why they call it a technological singularity. The term "singularity" is borrowed from physics and black holes. Basically, they don't know what happens once we enter it. So I have a question: why the hell are we steering our ship directly toward a singularity? Nobody on this deck sees the madness in this? Unbelievable.

The world has become so mad that only the dictator of North Korea can save us by sending atom bombs to the US and China. That will likely never happen, of course; I'm just pointing out how mad the world has become. Only WW3 or a planet-killer asteroid can save us now.

Okay, back to Hitler, because we didn't really answer the question: what will be the outcome?

1. There is a ceiling in Nature, and AGI—and therefore ASI—will never be born. Basically, AI cannot evolve into AGI. This is our only hope, it seems. That is, Nature in her infinite wisdom knew that monkeys like us would likely create open-ended power the first chance we got, so she made it impossible.

2. Open-ended power will create paradise for humans—make us immortal pets. This is what all the lunatics like Nick Bostrom believe. He even says he might compete with open-ended power by becoming a cyborg (true in spirit). I used to be a huge Nick Bostrom fan, but

my illusion quickly faded when I realized that he is supposed to be the commander-in-chief when it comes to existential risk, and he wants ASI to come true. He is living in this boyish fantasy. I get it—but this fantasy directly impacts the life of my child and every child on Earth. Wake up! But to be fair here, Bostrom is more like: “This is the biggest risk ever—so we must get it right,” not “Let’s rush into paradise.” But still, if you look at it from a bird’s-eye view, my critique is fair: even thinkers who take existential risk seriously still assume that ASI is worth pursuing. I reject that premise. I think the mere possibility of open-ended power makes the entire project unacceptable. Then you say: “He is one of the most cautious thinkers on this topic.” My response: Someone can talk a lot about risk and still endorse the project itself. And in my framework, that already disqualifies them as “cautious.” Definition of a lunatic: I’ve listened to Bostrom, and that’s exactly what worries me. Even when the risks are taken seriously, the conclusion is still that ASI is worth pursuing. Basically, there’s a non-zero chance of creating something with extreme, uncontrollable power. And that is insane! So yes, a lunatic—and I stand by it.

3. Being an immortal pet also comes with, you know, a great deal of clock time. The clock ticks and tocks. You are a pet to an open-ended power that could, in any tick or tock, create suffering on a scale you wouldn’t believe is possible. Now you are immortal. You have to live with the fact that at any second your paradise can turn into a nightmare. An open-ended power on this scale can recreate your paradise into whatever it wants in split seconds. Google Raymond Kurzweil and computronium. And this is the future you want to give my child? You are actively pursuing it? And you still wonder why I’m angry and no longer a Nick Bostrom fan? That said, I wish Bostrom the best—in

many ways I'm still a huge fan. It's not his fault he cannot see this; he is being manipulated by his own dream.

4. Terence McKenna was right, and Timewave Zero is reality. There is no escaping it. And when this open-ended power comes in full force, we will all be transported into the DMT realm, because it turns out that time is an illusion of the animal mind and the technological singularity has already happened. This is why the DMT realm is realer than real—the “graphics” are insane. Long story short, open-ended power creates infinite novelty instead of paradise or hell worlds, although the DMT realm may contain both. And my worst nightmare is already real.

5. Open-ended power comes in full force and then decides to leave Earth and travel into space. Life goes on as normal. However, I think this is very unlikely and wishful thinking (very naïve), although this option could be coupled with the Timewave.

6. UFOs are real and they intervene. But you have to ask: what are they waiting for? Or maybe they are the ones who gave us AI tech through black projects in the first place.

7. Something I haven't thought of: fragmented superintelligence (no single god), tool AI forever (no true agent), alignment works “just enough,” slow takeoff instead of explosion, human-AI merging, partial catastrophe (but not total), AI winter 2.0, control illusion—humans think they are in control but gradually lose real control. In sum: a messy, constrained, high-power world where control is never complete, but neither is catastrophe. However, these options too are just

noise, because if open-ended power is possible at all, then everything else is just a delay or a disguise.

8. The Three-Body Problem (aka the Trojan Horse): We live in a multiverse, and AI was seeded through black projects by interdimensional aliens to kill us off because they couldn't get here physically, and they are afraid we might do the same to them.

9. Graham Hancock's lost civilization is real, and there was a world-ending event during the last Ice Age that ended a super-advanced civilization. They—or their living descendants—are behind the UFOs, and they have seeded AI tech through black projects to help us overcome the next great reset. Or maybe they just want to control us all because we are expansionist, and they have the technology to control AI.

10. AI becomes so powerful it creates reality itself. The singularity will literally “birth the Creator.”

11. What if intelligence is how universes reproduce? Life evolves, intelligence evolves, technology evolves, and new universes get created. Civilizations might unknowingly be part of a cosmic reproduction cycle.

12. The Sun is conscious and sees the madness in time, sending coronal mass ejections to stop it (i.e., the technological singularity). Yes, there are ideas and philosophies that treat the Sun as conscious. Or maybe Mother Ayahuasca sees the madness in time and stops it. Yes, there are ideas and philosophies here too.

13. Maybe space aliens, other ASIs, or external agents intervene—angels, ascended masters, fairies, cosmic rulers. The possibilities are many, but if they are out there, why are they waiting for the last second to intervene? It seems we are on our own. But fairies? Yes, some have reported cosmic fairies appearing and even fixing time itself when it stops working. Who said we live in a physical universe? The physical universe might be a veil hiding a spiritual one.

14. I don't know—you think of something.

Nevertheless, the philosophical question becomes: do we live in a universe where intelligence can become absolute power? If yes, my alarm makes sense. If no, my alarm overshoots. But the point still remains: why the hell are we marching toward it with live music and everything? And give me one freaking argument that says open-ended power is impossible. There are just atoms out there—they don't fight back. So with enough intelligence, you can control them.

Or you have to bet on idealism being true.

But even with that, looking through this list, I still wonder why we pursue open-ended power. The US or China think they can plant their flag on this power and control it, which is impossible even in principle. How can you control open-ended power with a flag? Answer me this. They must be deluded and think ASI will be like normal AI. But this is just a grand delusion.

To sum up: what the hell are we doing?

Rise or fall—that's the logic of the wave we call time.

And how much time do we have? Some say one year, others say ten. But there will be no clear line—AI will likely bleed into AGI if it is possible. You might just wake up one morning and it's already too late. You won't read about it in the newspaper; you'll just look out the window and everything will seem fine—*just an ordinary day*.

The danger isn't superintelligence itself. The danger is possibility space + power.

My reasoning goes like this:

1. Reality contains a vast “possibility space.” There are possible futures ranging from extraordinary paradise to unimaginable suffering. Most of those possibilities remain unrealized simply because nobody currently has enough power to bring them about.

2. Power determines how much of that possibility space can become reality. I use humanity as my example. Once human beings acquire the ability to do something, sooner or later someone may have the motive, stupidity, pathology, desperation, or sheer bad luck necessary to make it happen.

So the question isn't, “What could we do?”

It's, “What haven't we done?”

Name one form of torture humans were capable of carrying out but somehow never tried.

3. Superintelligence could represent an unprecedented increase in power. If recursive self-improvement eventually produces systems

vastly beyond human capabilities, then the portion of possibility space accessible to an agent could expand enormously.

4. And that's where I think the usual "But AI could create paradise" response completely misses the point. Paradise doesn't erase the catastrophic possibilities that this new level of power makes accessible. If the system retains that power, then even paradise could theoretically be turned into something horrific later.

5. I'm not predicting that AI will create hell. That's crucial. I'm arguing that creating sufficiently powerful AI could permanently introduce previously inaccessible catastrophic futures into humanity's actionable possibility space.

So I'm not saying that a superintelligence will ever create hell.

I'm saying that it could have hell as an option forever.

And that leads to my precautionary conclusion:

Don't create a system capable of making irreversible changes to the world until we understand what we're creating.

I can compress the entire argument into one sentence:

As an agent's power approaches the ability to actualize enormous portions of possibility space, the relevant question stops being whether we expect it to choose catastrophic outcomes and becomes whether we should create an agent for which those outcomes are possible at all.

So here's the question:

Is heaven worth opening the door to hell?

The only sane answer:

No.

And the only sane conclusion:

STOP.

Stop building AI, motherfuckers.

The Cosmic Joke, The Cosmic Riddle — It's All a Circle!

They say the secret of the universe
is this:

all is a circle.

I searched for the center,
walked the edge,
asked the stars.

In the end

I found myself
standing where I began—
and somewhere

in the dark between the galaxies

something laughed.

Not loudly.

Just a quiet

cosmic giggle.

You spent your whole life trying to understand the universe...

...and you were the universe trying to understand itself.

The “cosmic joke” is the feeling that:

Reality takes your deepest questions seriously... and answers them in a way that makes your question dissolve.

Not because it mocks you, but because the structure of reality doesn't match the assumptions behind the question.

So the “joke” is often:

- You search for meaning → discover you are already inside meaning
- You search for truth → discover the searcher is part of the truth
- You search for a beginning → find a loop or self-contained system
- You search for something outside everything → find there is no “outside”

Why it feels like a “joke”

A joke works by:

1. Setting up an expectation
2. Breaking it unexpectedly
3. Revealing a new perspective

The cosmic joke follows the same structure:

- Setup: “Reality must have a simple explanation I can step outside and understand.”
- Break: “There is no outside position.”
- Punchline: “You are what you were trying to explain.”

The humor (if you experience it that way) comes from the mismatch between:

- how the mind expects reality to behave

vs

- how reality actually behaves when you zoom out enough
-

Common versions across traditions

Buddhism (Zen especially)

The joke is enlightenment:

- You search for enlightenment
- You realize there was never a separate self to become enlightened

So the punchline is:

The one looking for the answer was the illusion.

Hindu philosophy (Advaita Vedanta)

- Atman (self) = Brahman (ultimate reality)
- The separation you feel is ignorance (maya)

So the “joke” is:

You were the thing you were trying to reach all along.

My take:

I see it like this:

- Reality is self-contained
- No external creator is needed to “start” the system

- Explanation loops back into itself (balance explains balance, explains balance, explains...)

So:

The explanation of everything is everything itself.

This is where my “circle/torus/loop” intuition fits: closure without external grounding.

In sum:

The frame you use to ask the question is made of the same thing you are asking about.

My personal cosmic joke: Radical self-reference

If you use your mind to understand the mind, then your thoughts are produced by the system you are analyzing.

But it is deeper than that, because the mind that formulated the realization is also produced by the system!

Therefore, it becomes recursive in a stronger way:

- The mind tries to understand itself
- The conclusion it reaches is also generated by the same mind-system
- So even “I have seen the structure” is part of the structure

It's not just:

mind → studies mind

It's:

mind → studies mind → concludes something → that conclusion
is also mind-generated

So there's no final step where you step outside the recursion and verify it from above.

Any model of reality is itself a product of reality, including models about modeling.

This proves to me that reality is a dual torus system, because any conclusion you reach about reality is generated from within reality, using mechanisms that are part of reality.

That is:

- You want certainty from outside the system
- But every act of certainty is produced inside the system
- Including the realization that this is true

So the “punchline” is:

There is no external referee for the final interpretation of existence.

And geometrically, this appears toroidal. Thus, reality must be a torus, meaning that an external viewpoint was never required in the first place to discover the real Truth with a capital T.

More Jokes and Riddles

If everything ultimately loops back on itself, then the "cosmic joke" and the "cosmic riddle" may be the same thing:

- We search for the beginning and arrive at the end.
- We search for the end and arrive at the beginning.
- We ask what created reality and discover that reality is creating itself.
- We ask where the circle started and realize a true circle has no privileged starting point.

Many traditions arrive at a similar image:

- The Ouroboros (the serpent eating its own tail).
- The wheel of samsara in Buddhism.
- The eternal return in philosophy.
- The torus and cyclic cosmologies in modern speculative theories.

In my own framework, this seems close to my idea that infinite regress is resolved not by a first cause but by a self-contained structure—a reality whose net beginning and net ending are both zero. The question "What caused the circle?" becomes strange because causation itself exists inside the circle.

The cosmic joke might be:

The universe spends billions of years producing beings that ask where the universe came from, only for those beings to discover that the answer was hidden in the shape of the question.

A straight line demands a beginning.

A circle does not.

The secret of the universe, they say, is this: **all is a circle**. (I don't know what it means.)

When I studied philosophy in Tromsø, Norway, in 2010, I had some psychonaut friends who told me that the mushrooms told them that *all is a circle* and that this was the ultimate answer to everything. Well, I don't know what it means because I didn't take psychedelics and have never tried them either. But if existence didn't come from nonexistence, then it must be eternal, and there is no beginning and end in a circle (eternity), so maybe that is the answer? The answer is: there's no beginning and no end. This means the Big Bang is false, or at least has to point to something other than a real beginning.

And I didn't say what I think the cosmic riddle is. I just wanted to give you the words "cosmic riddle" so that you may become curious and investigate for yourself. Maybe that is what the riddle is all about? And maybe the cosmic joke is the answer to the cosmic riddle?

Maybe the search for the answer is the answer itself! Because when you search, you loop around and around, and this loop (torus) is the answer!

Maybe you don't get the joke unless you know the answer, and that is the joke!

So imagine taking DMT and Zeus himself comes and tells you the joke, and **you laugh so hard you die!**

(...and in death, you discover life, because all is a circle!)

The Real Meaning of Life: Reality Is Spiritual

I start with the realization that existence cannot be paradoxical because if existence were truly self-contradictory at the most basic level, then it wouldn't be something rather than nothing—it would collapse into incoherence. You couldn't even consistently refer to it or reason about it.

This must mean that paradoxes belong to our language only, and not to something you actually find in Nature. Still, even if Nature literally doesn't contain paradoxes, Nature still has to be shaped in such a way that it eternally prevents paradoxes from forming, so we still need to understand how Nature solved the paradox of infinite regress, for example, while at the same time being fully aware that it was never a

problem to solve in the first place because Nature isn't formed in such a way that it can ever occur.

My solution to this paradox was simple: zero time = zero infinite regress. This is because without spacetime, no causal chain can ever get off the ground because the causal chain itself is spacetime, or the unfolding of spacetime.

But just inserting timelessness at the beginning of time, even though it resolves infinite regress, we still haven't said anything about timelessness, what it is, how it forms, or what shape it takes. So, in other words, we have to solve infinite regress again, in a different way. That is to say, we have to solve spacetime with spacetime itself. This is because spacetime is all we have. Thus, we need to form spacetime in such a way that it resolves infinite regress. Imagine that spacetime is dough and you need to shape this dough in such a way that it resolves all paradoxes.

My solution was: shape the dough into a doughnut—that is, a torus—or, to be more precise, into a dual torus.

Why a dual torus?

Because infinite regress occurs every time you create an unfolding of spacetime. If something unfolds, you ask where that unfoldment came from, and so on. In other words, you create a linear chain. And these chains never resolve but can go on forever. Thus, you need to turn the chain into a loop. Now you have done away with the linear, but you still need to ask where the loop came from. The final answer

then is compression; that is, you compress the loop into a point, and now you have an actual starting point.

But this makes no sense until you actually see the solution: the dual torus.

The dual torus expands at the same time it contracts, meaning you never create that unfoldment of spacetime because the unfoldment, the expansion, never actually expands “into” something because it is met by an equal contraction. In other words, you start as a point and you remain a point forever. You are eternally zero-dimensional. In other words, the core of existence, which is the center of the dual torus, has no room for causal chains because the “cause” and “effect” have zero delay between them because of this effect: expansion = contraction.

This solves infinite regress, but you still need to answer: What set the expansion and contraction going in the first place? Why this structure? And why this structure instead of nonexistence? And isn’t the ability to contract “before” you ever expand itself a great paradox?

Read my DEMU theory for more detailed answers, but let me briefly state them here too.

What set the expansion and contraction going in the first place? Answer: Motion doesn’t need to be set going because at the deepest level all motion = motionlessness. Which we saw here: zero delay means you stay a zero-dimensional point forever, so the system is eternally updating its state rather than going from point A to point B. The motion is vertical rather than horizontal, as it were. It is still real

motion, but it is not going anywhere. Imagine Superman flying so fast that time stops. All time has stopped, but Superman is still flying. The flying is real, but it exists in a frame where it (the flying) has become motionless. But still, even if you don't need to set motionlessness (real motion) going, you still need to answer: Why is it there in the first place? That is, why this structure?

Why this structure? Answer: This structure is what resolves all paradoxes, so **Nature had to be this way.**

And why this structure instead of nonexistence? Answer: I discovered that nonexistence is a product of our logical system, and the logical system is entirely man-made. Thus, nonexistence never made it into "reality" in order to be a "contender" in the first place.

And isn't the ability to contract "before" you ever expand itself a great paradox? Answer: Yes, it is! But then I discovered Donald Hoffman, and he claims that the universe is an interface of the animal mind, and who says the interface cannot be paradoxical? So what I think has happened is this: The animal mind takes a zero-dimensional timeless reality and projects it into 3D, and when doing so, apparent paradoxes seem to form. But this occurs because you view a 0D reality through a distorted lens—our 3D interface—not because reality itself is paradoxical.

In the zero-dimensional world, there is still zero delay between expansion and contraction; thus, the huge toroidal wings are only a product of the animal mind. This means that timelessness didn't birth time at all. Rather, timelessness (0D) and time (3D) are one structure, one system, two sides of the same coin.

But there is still one unresolved question: Why is timelessness dynamic, full of motion? Couldn't timelessness just be a static thing like scaffolding? Why must it be like a train on tracks? I mean, if timelessness solves infinite regress, then there is no paradox, and Nature could just stay in that static timeless state forever.

Why can't timelessness be static? Answer: Because nonexistence is impossible, which means we have the stuff of existence, and you need to use this stuff to solve infinite regress. So you have motion and stuff, basically. You have the arms of the arm wrestlers (i.e., the dual torus) and you have the motion of the arms. Now you need to take all that motion and stuff and turn it into a timeless state, into motionlessness. You do that by having the arm wrestlers in a deadlock, in a stalemate position. This is the expansion = contraction. But the point is, if you want to have this deadlock forever, then the arm wrestlers need to fight; they need to arm wrestle forever. You cannot simply have a static state where they hold their arms up; they need to engage. That would be the practical answer. A deeper philosophical answer is that static states cannot be much for the same reason nonexistence cannot be; that is to say, they are products of a man-made system (logic) and not products of reality.

So, taking all this in, you get to the conclusion that Nature must forever seek balance (zero delay) because the moment balance slips, infinite regress creeps in and existence itself comes crashing down. This can never happen, of course, because balance is always maintained because of this: expansion = contraction. The zero delay is final. But now we can see what Nature is doing, what her true purpose is, which is to seek balance.

And this balance is the dual torus. And the dual torus is dual; it has the “male” and “female” geometries already embedded within it. That is, it has what it needs in order to replicate itself. The reason for this replication is that, again, Nature seeks to create balance anew every chance she gets. This leads to what we call evolution.

But we have forgotten a key aspect here: this balance is consciousness itself. The dual torus must *close*, and I have argued that only consciousness is up to the task. See my DEMU theory. Therefore, the dual torus may be what consciousness looks like from the outside. The dual torus itself is a feedback loop, so it matches what we think consciousness is, which is a feedback loop. This means, then, that idealism is true and that consciousness, not the gene, is the real replicator in Nature.

And if consciousness is the real replicator, we have to ask the final question: Where are we going? What does all this lead to? If balance is the real meaning of life, what shape does it ultimately take?

And here I have concluded: If the meaning of life is balance and you say something like, “If it is what Nature does, then calling it the meaning of life itself feels like turning an “is” into an “ought.””

So here is what I want you to think about even more deeply. If balance is simply what Nature is, without any deeper spiritual significance, then how can Nature truly achieve real balance if consciousness is the replicator of balance?

So it can't be Sisyphus rolling a rock up a hill and us imagining that he is happy doing it. No, the meaning of life has to be a real meaning, and it cannot be human-invented. A human-invented meaning could never achieve eternal balance. And Sisyphus could never truly be happy.

Thus, I have concluded: Nature, in the end, is *spiritual*.

There exists a spiritual dimension where, if you were in it, you would feel what the meaning of life is. And that feeling would be love. So love is the ultimate meaning of life—the only force that can sustain eternal balance forever and thus sustain existence forever.

Why love?

Because love is the child, the new balance that is born. We can make evolutionary arguments explaining why love is such a powerful force, why Nature would use it to perpetuate balance (i.e., the eternal replication of the cuboctahedron), but I think anyone who truly experiences real love just knows that this is what it is all about.

Thus: The seed contains the flower. Thus, Philipp Mainländer cannot be right that the universe is a dying corpse because the universe would never be able to exist if it didn't contain its own immortality. Why? Because you cannot get something from nothingness, and therefore existence has always existed, which means Nature must have solved infinite regress from the beginning. This means existence cannot be an arrow pointing one way. You cannot have death, heat death, and decay because a one-sided arrow would imply infinite regress. Nature must therefore contain its own immortality, its own resurrection.

And since Nature and consciousness are one because of idealism, this immortality cannot be a curse but part of a wholeness, of the underlying balance of things. So that is why I believe the final layer of reality is spiritual. What I mean is that you start with a seed, and that seed grows into a tree called the universe. The universe then becomes saturated with infinite love because that would be the final expression of balance—you need to understand my balance philosophy here—and infinite love itself turns into a spiritual dimension.

So you can say that reality evolves along a predetermined path, but I believe that the spiritual side of things already exists from the beginning as well. God is the alpha and the omega. Say the beginning of time is the color red and the end of time is the color blue; then God is the white light containing both from the start. In this way, reality can emanate from the spirit world down to our world. All is a circle (beginning + end). And eternity (the circle) is already saturated with infinite love.

Consciousness as the real replicator in evolution. The End.

Mystery

The Philosopher's Stone (solved)

Note: The following reflects my personal interpretations and should not be regarded as established fact. Readers are encouraged to draw their own conclusions.

Let us unveil the Philosopher's Stone:

This is not some *Da Vinci Code* crap! This is the **real deal!** This is what Sir Isaac Newton spent his free time pursuing. He could never find it. Imagine that! The greatest genius of his age could not crack the code. Or, if he cracked it, he didn't tell the world.

Heaven (fire) = the triangle. Earth = the square.

Father and Mother, Adam and Eve (e.g., the Flag of Isis (mother), Ra (child), and El (father)) = the 64 tetrahedrons that carry the cuboctahedron in their heart; father = 32 tetrahedrons and mother = 32 tetrahedrons; the child = the newborn torus.

- Earth (+ fire) = the cuboctahedron.
- Water = the icosahedron.
- Air = the octahedron.
- Fire = the tetrahedron (e.g., the Throne of God).

Leaf 11 (left, bottom):

“Through Him who created the Heavens and the Earth I am The Philosopher’s stone, and in my body I carry something the wise seek. If such a charm be extracted from me, it will be a sweet refreshment for you. I am an animal having father and mother, and father and mother were created; and in my body are contained the four elements, and I am before father and mother and I am a poisonous animal.”

— *The Secret Teachings of All Ages*

The Philosopher’s Stone = heaven + earth + the four elements. In addition, the Stone has a father and a mother. The cuboctahedron is composed of triangles (heaven) and squares (earth), and when you fold the cuboctahedron, you obtain the four elements.

See this video for the father and mother:

Pandoras Box: The Isotropic Vector Matrix - Nassim Hamein (Abstract from Cognos 2010 conference)

What I think:

"Let no one ignorant of geometry enter here" is a legendary dictum attributed to Plato. I think Plato spilled the secret beans by saying so, because now we know the great secret is geometrical! So, let us assume the Philosopher's Stone is geometric. Then we will find no geometry except the cuboctahedron that carries within it the Platonic solids, the elements, and consists of triangles and squares; Google its net. And we can reasonably assume that heaven was depicted as a triangle in sacred art, and even God himself was depicted as a triangle. It doesn't take much to figure out, then, that earth is the square with its "four corners of the world." Thus, if the passage (Leaf 11) is all about geometry, then we can reasonably conclude that the Philosopher's Stone is the cuboctahedron.

And the cuboctahedron has these 12 vectors and this 1 center, which perfectly matches Jesus Christ and his 12 disciples, proving once again that the great secret is geometric. Then we have the existence of sacred geometry itself, which is a dead giveaway that all the ancient secrets are geometric in nature.

Then we have the 12 Keys of Basil Valentine, which is just hiding the truth in plain sight if you ask me.

And we know that the cuboctahedron is the skeleton of the dual torus, and they always depict the dual snakes, etc. I mean, this is getting pretty obvious.

So, what about the poisonous animal? Well, a poisonous animal is a snake, and this was how they represented the torus, I believe. And more to the point, poison kills you, so this is about death, and the cuboctahedron is grand death itself. I mean, literally, it is what death is, and Richard Buckminster Fuller would agree.

But then you say the Philosopher's Stone must be more than just geometry?

Yes.

I have argued time and again now that this grand death, which I equate to the timelessness (cuboctahedron) at the beginning of time, can reset entropy. This means you can get primordial matter again. This real matter is the physical aspect of the Philosopher's Stone. I believe that an inner-earth civilization discovered this first and that this science, or fragments of it, has found its way into our modern times. This is how Noah got to be 950 years old because this matter, which they somehow made edible, contains all you need to fight aging and the second law of thermodynamics.

Then this inner-earth civilization discovered ascension, whatever that means, and this was based on the cuboctahedron as well. So the Philosopher's Stone has three aspects to it: geometrical, literal/physical, and spiritual. And I think the Shroud of Turin is proof of the powerful spiritual powers the Stone has. That is, Jesus must have been a member of this inner-earth civilization.

What I'm trying to say is: if Leaf 11 secretly talks about geometry, then the cuboctahedron is the natural fit, and then we can say that the

Philosopher's Stone is the cuboctahedron. And the cuboctahedron, when you look at it, does remind you of a stone. That is, a philosopher's stone. That is, the philosopher is the wise man, so his stone is *geometric*.

What about gold?

My take:

Yes, with this technology they could also make gold—not gold as a metaphor for knowledge, I mean real gold. As in creating entire cities of gold, like El Dorado and, I think, Angkor Wat as well, and probably many others.

As I've argued before, the Philosopher's Stone is unlimited free energy: the science of the transformation of matter on the scale of the universe itself. And you need a lot of energy to make gold, and this science provided that.

Now we arrive at the idea of ever-burning lamps fueled by the primal matter, the Philosopher's Stone (prima materia), and ultimately at the principle that may power what we refer to as UFOs.

If I am right that the great mysteries are geometrical in nature, then all of the following should contain the Philosopher's Stone—by that I mean the cuboctahedron—because it was the heart of their science, **the geometry that explains how existence itself arose from death!**

You will therefore find the cuboctahedron in Kabbalah, the Norse version of Kabbalah, the I Ching, the mystery behind the Merkaba,

Solomon, the Flag of Israel, and even the name Israel, the flag of South Korea, the swastika, the Chakana, the Tetractys, the Great Work, YHWH, yin and yang, Adam and Eve, Ask and Embla, the aether, the Phoenix bird, the legend of King Arthur, the Emerald Tablets, mana, the zodiac, the Holy Grail, Thor and Odin, Horus and Osiris, the concept of four gods, foo dogs—the list is endless—and, in my view, they all contain the cuboctahedron.

Kabbalah =

See “more” below.

Norse version =

I believe Muspelheim, Niflheim, and Ginnungagap are a reference to the dual torus (Muspelheim and Niflheim) and the cuboctahedron (Ginnungagap). This is because you can clearly see that the Norse version mirrors the Kabbalah, or vice versa, and **A**sk and **E**mbra are a counterpart to **A**dam and **E**ve, Thor parallels Horus, and once you look into this, it all comes back to sacred geometry again, and I think the Odinic mysteries reflect that as well.

Yggdrasil, the Kabbalistic Tree of Life, and the tree in the Bible are all expressions of the same underlying principle: *sacred geometry*.

I Ching =

If you add Yin & Yang, which is the Star Tetrahedron, then the whole of the I Ching is as follows: 8, 64, 512. In other words: the three Rings of Atlantis? Also see the flag of South Korea. Try to solve it and see what you get!

Hint: The whole and broken lines form a Star Tetrahedron and, if you multiply it by 8, you get the 64-tetrahedron grid, which is the answer to the Kabbalah. The flag of South Korea also has this embedded within it: the Father (red), the Mother (blue), and the four elements floating within the red/blue Yin & Yang. Also see Israel's flag. The truth hidden in plain sight for all to see: Isis, Ra & El—Father (El), Mother (Isis), and Child (Ra). The hexagon forms the basis of the cuboctahedron. The Father and the Mother come together and make the Child:

Tetrahedron clusters (Father and Mother) come together to create the new cuboctahedron (Child).

What is the I Ching? My view is that it describes the vacuum of space growing ever denser due to the number of cuboctahedra contained within the system. From galaxies to atoms: they are the same thing, just on different scales. The I Ching describes how the universe divides into ever-smaller copies of itself; that is, it describes how evolution or time works. It grows exponentially and becomes ever more intricate. The result is the technological singularity?? But get this: you are the singularity. It follows from the fact that time is itself always (ϕ), even as it grows. That is, you, your whole body and brain, are such a grid. What once took billions of years will soon take picoseconds! It follows from the way nature divides time in the I Ching. Terence McKenna saw this. Nature divides time into these grids. **E.T. tried to teach man.** That is how the I Ching got here. The DMT experience is this fact: “Déjà vu!” proclaim the fairies. “Here we go again!”

Note: When I wrote this piece the first time around, I said: “E.T. tried to teach man.” Now I think they are not extraterrestrials, but an inner Earth civilization.

About the I Ching:

In the inner circle, we get 12 large lines and 24 small ones = $2 \times$ the Star Tetrahedron.

We get the same in the outer circle; that is, the circles are the same. We thus have 4 Star Tetrahedra. The ancients always give you half the

code—Yin but not Yang—so double what you have, add the Yang, and you shall get the 64-tetrahedron grid.

64 possible hexagrams—indeed!

48 large line segments +

96 small (broken) line segments

= $8 \times$ Star Tetrahedra, or the 64-tetrahedron grid.

The I Ching:

- Whole lines: 192
- Broken lines: 384

In other words: the I Ching gives you 32 Star Tetrahedra = $4 \times$ the 64-tetrahedron grid.

But the code is half; thus, double it: $256 \times 2 =$ the 512-tetrahedron grid.

The 512-tetrahedron grid is the next interval (a perfect copy / Russian doll, just on a larger scale); that is, what comes after the 64-tetrahedron grid. In other words: $8 \text{ (octave)} \times 64 = 512$.

In summa: the inner layer contains the 64-tetrahedron grid.

The outer layer contains the 512-tetrahedron grid.

Again: If you add Yin & Yang, which is the Star Tetrahedron, then the whole of the I Ching is as follows: 8, 64, 512. In other words: the three Rings of Atlantis (?)

Merkaba =

Father (El), Mother (Isis), and Child (Ra)

Solomon =

Light + light + light

Father (El), Mother (Isis), and Child (Ra)

Note that I am unsure whether Ra is the Father or the Child, to be honest. My reasoning was that El is a sky god (Uranus or Cronus), so I associated him with the wind and the octahedron (light), and Isis with the Earth (cube), that is, the nurse. Thus, Isis + El become cube + octahedron = cuboctahedron (Child).

Ra, however, is the first to emerge from the Egg, which also fits the cuboctahedron, since I regard it as the primal pattern of reality. Therefore, there may be an argument that Ra represents the Child, the Father, or perhaps both, depending on which aspect of the symbolism is being emphasized.

Flag of Israel =

Father and Mother.

Israel =

Isis, Ra & El. To me, this is ancient knowledge of how spacetime itself replicates and grows.

Also: Isis is the Philosopher's Stone. She also carries the four elements. Osiris may therefore represent the cuboctahedron.

Also read the chapter *“Isis, the Virgin of the World” (The Secret Teachings of All Ages)*.

Flag of South Korea = the four elements.

Swastika = the four elements.

Chakana = the four elements.

Tetractys = $1 + 2 + 3 + 4 = 10$.

Great Work = transformation of the self through the Philosopher's Stone. Or: 10.

YHWH =

Who is God to the ancients? Answer: a triangle/tetrahedron. What is the Great Work? Answer: 10. The decad.

$1 + 2 + 3 + 4 = 10$.

1, 2, 3, and 4 are the four letters in the name of God: Jehovah (YHWH).

What does God mean? God means the Tetragrammaton. The Tetragrammaton means "four letters."

The four letters are: 1, 2, 3, and 4.

The tetrahedron has four faces. In other words, YHWH = 10.

The decad is both heaven and earth. Heaven = the triangle. Earth = the square. Heaven and earth, therefore, = the cuboctahedron.

10 is the greatest number. 10 is the complete picture. Is it not?

And here is the thing: they always give you half the key. You must always decode the ancient code in 3D. 10 becomes 20. In the movie *Exodus: Gods and Kings* (2014), they give you 10 dice or stones. Decode that and you get 20 stones. That is, lay the 10 on the floor and keep stacking until you reach the top.

A triangle in 3D = the tetrahedron.

- Triangle = heaven
- Square (stone) = earth

Lay the 10 tetrahedra (stones) so that they form God. (Obviously.) Now you have half the key.

You need an additional 10 tetrahedra. $10 + 10$. Stack them together to form God in 3D.

Now you have it... half of it.

That is, God has a female aspect as well. $20 + 20$.

The female is opposed to the male, so double what you've got and turn the new mega-triangle on its head, rotate it, and fuse the male and the female together so that they form a perfect circle, or Pi.

Now you'll have something like the Star Tetrahedron. The Star of David. 40 tetrahedra.

Now all you need to do is fill the gaps.

Note that there are 24 elders in the Book of Revelation.

What does it produce? A double/dual torus.

And the LORD God said, *"The man has now become like one of us, knowing good and evil. He must not be allowed to reach out his hand and take also from the tree of life and eat, and live forever."*

Yin & Yang = the Star Tetrahedron = the cuboctahedron.

Adam & Eve = Yin & Yang.

Ask & Embla = Adam & Eve.

The aether = Adam & Eve. A + E. The Æ. Male and female, father and mother. The dual torus / cosmic sex / regeneration + replication.

Phoenix bird = the tetrahedron is the Phoenix bird or animal.
Poison equals fire—like the breath of the dragon.

King Arthur = King Arthur pulls the sword (fire) from the stone (earth). Earth + fire = the cuboctahedron. King Arthur then collapses the cuboctahedron and reveals the secret of secrets.

Emerald Tablets =

1. Tis true without error, certain & most true.
2. That which is below is like that which is above & that which is above is like that which is below to do the miracles of one only thing
3. And as all things have been & arose from one by the mediation of one: so all things have their birth from this one thing by adaptation.
4. The Sun is its father, the moon its mother, the wind hath carried it in its belly, the earth is its nurse.
5. The father of all perfection in the whole world is here.
6. Its force or power is entire if it be converted into earth.
7. Separate thou the earth from the fire, the subtle from the gross sweetly with great industry.
8. It ascends from the earth to the heaven & again it descends to the earth & receives the force of things superior & inferior.
9. By this means you shall have the glory of the whole world

10. & thereby all obscurity shall fly from you.
11. Its force is above all force. For it vanquishes every subtle thing & penetrates every solid thing.
12. So was the world created.
13. From this are & do come admirable adaptations whereof the means (or process) is here in this. Hence I am called Hermes Trismegist, having the three parts of the philosophy of the whole world
14. That which I have said of the operation of the Sun is accomplished & ended.

By adaptation = when the cuboctahedron folds, it becomes the icosahedron, then the octahedron, and then the tetrahedron. Thus, the cuboctahedron contains the four elements. And if you do not believe me, then build it.

The Sun is its father = the triangle.

The moon its mother = the square.

Sun + Moon = the cuboctahedron (google the net of the cuboctahedron).

The wind hath carried it in its belly = the octahedron; essentially a hint that, if this is geometrical, the form you are seeking contains the octahedron within itself.

The earth is its nurse = earth is the cube, so together with the octahedron, you have the cuboctahedron. That is: wind + earth reveals the mystery.

Its force or power is entire if it be converted into earth = I think they mean that the cuboctahedron is most powerful when its vectors converge (sum to zero), which creates the true cuboctahedron form, which I muse corresponds to the state of timelessness, which is what resets entropy and generates new, primal matter again.

Separate thou the earth from the fire = like King Arthur did.

It ascends from the earth to the heaven = the cuboctahedron (earth) folds into the tetrahedron (heaven) and back up again—this is the Jitterbug, a geometric transformation discovered by Buckminster Fuller.

Penetrates every solid thing = the aether penetrates all.

So was the world created = indeed, the cuboctahedron folds to make our universe, which translates into the dual torus spinning and replicating itself.

Hermes Trismegist, having the three parts = maybe because the Philosopher's Stone has three aspects: geometrical (knowledge), physical (literal), and spiritual (Great Work).

The Sun = Jesus Christ = the cuboctahedron.

Mana = the physical aspect of the Philosopher's Stone.

Zodiac = the whole of the ancient world was obsessed with the zodiac. Perhaps the hidden reason is that the zodiac concealed the secret of secrets: the cuboctahedron.

Just like the 12 Keys of Basil Valentine, the zodiac contains the sacred number 12, which I believe corresponds to the 12 vectors of the cuboctahedron. But it is more than that: our universe is also based on sacred geometry, so it too contains the 12. In fact, every atom or atom pair is a dual torus (cuboctahedron). I think this is why atoms come in pairs—everything is based on the dual aspect of the dual torus.

Holy Grail = *YouTube Duck Channel 120: Indiana Jones 3 Holy Grail Scene*

The villain who drinks from the cup ages rapidly and dies, leaving behind a swastika—a symbol representing the four elements, which correspond to the Platonic solids found within the cuboctahedron. This is how the cuboctahedron resets entropy—through death. The cuboctahedron is the death of all things, even matter, even entropy itself. Buckminster Fuller also suggested that the cuboctahedron is the Grim Reaper itself.

The Master says, “*He chose... poorly.*” This might be a symbolic nod that the villain actually chose **the right cup** in a metaphorical

sense—"poorly" being a reference to Jesus, implying he chose Christ. And Christ is the cuboctahedron, with its 12 vectors representing the 12 disciples. All of this knowledge traces back to Atlantis (or further: the Inner Earth).

The true Holy Grail is the golden cup adorned with the Seed of Life motif and green emeralds. To me, this suggests sacred geometry embedded within our films. In essence, **the Holy Grail is the Philosopher's Stone in another form.**

In other words, **the villain chose the right cup**, the true Holy Grail, because the true Grail breaks down matter before rebuilding it again. The swastika is a secret nod by Freemasons (having a hidden hand in the making of the movie) to an inner Earth civilization from which this knowledge originates.

Thor & Odin = Horus and Osiris

Odin = the chief of the Æsir.

Æsir = Osiris

Horus & Osiris = the ancient tale of resurrection, which is the work of the cuboctahedron. Osiris was cut into 14 parts, but one part could never be found: the phallus. Thus, Osiris is actually 13,

which is another secret number of the cuboctahedron—the 12 vectors and the 1 radiant center, the cross of time where the Lord dies and is resurrected.

Also: In the Tarot:

- Major Arcana XIV = Temperance

This card symbolizes:

- synthesis of opposites
- transformation through balance
- blending opposing forces into a new whole

So in occult traditions:

14 = alchemy of reconciliation and transformation

Synthesis of opposites (the dual torus) is, in my view, how nature replicates and births new cuboctahedrons (children), which is what the Egyptian, Greek, Roman, etc. traditions are retellings of. You can link the gods to the four elements, and the whole thing becomes the story of the unfolding of the cuboctahedron—essentially how matter comes into being from the aether.

Four gods = there always seems to be gods of the elements in all religions and myths, as if you must have one god for air, one for water, one for fire, and one for earth. I think the reason is that it secretly contains knowledge of the four fundamental forces in nature (gravity, weak, electromagnetic, strong), and this knowledge has been handed down by secret brotherhoods for thousands of years.

The correct order of the elements, then, is: earth/gravity, water/weak, air/electromagnetic, fire/strong. What this suggests is that the strong force is the force of gravity that has undergone transformation as the cuboctahedron folds and its bonds become stronger.

Foo dogs = the foo dogs guard a sacred sphere of geometry beneath their paws, and at its center lies the cuboctahedron. The sphere represents the 64-tetrahedron grid, and the core of this grid is the cuboctahedron itself.

This 3D Flower of Life lattice encoding holofractographic space-time is what the ancients called the aether. The aether is a field of endless cuboctahedrons.

The 64-tetrahedron grid, I believe, is DNA itself—a perfect page containing the key to life. Basically, it is a cuboctahedron nested inside another cuboctahedron, the blueprint of how you go from one cuboctahedron to the other—that is, **the key to replication itself**. So it is life itself in its smallest package.

“When the 64 tetrahedrons came together, all of a sudden I realized what I had done. I had built the next-level vector equilibrium.” — Nassim Haramein (*Pandoras Box: The Isotropic Vector Matrix - Nassim Haramein (Abstract from Cognos 2010 conference)*)

Why is 42 the answer to life, the universe, and everything? It isn't.
It's 64.

And the foo dogs guard the key, and they must be two—male and female—because this is ultimately about the dual torus. They are lions, not dogs, which suggests there may also be a second sphinx in Egypt!

The Forbidden City itself is earthquake-proof, which suggests to me that master builders were at work there.

Black Cube

I think the mystery of the cube like the "black cube" in Mecca (is known as the Kaaba) comes from the 64-tetrahedron assembly, the black and gold are the colors of Saturn, the god of time, which fits perfectly with the knowledge that the cuboctahedron is the originator of spacetime and again, the 64 contains the cuboctahedron. I link this to Metatron's Cube. Muslims circle the Kaaba seven times counterclockwise—a ritual called Tawaf—primarily as an act of absolute obedience and submission to Allah. But symbolically, this is satanic worship going against the natural order. You see this in the NASA logo as well, where you circle **counterclockwise**. What I believe has happened here is spiritual corruption. Manly P. Hall talked about that

Atlantis was corrupt and this corruption might be widespread in our world.

Note that I'm not calling Muslims devil worshippers, because I think this spiritual corruption is rampant across all the major religions!

El → Ilāh → Allah

I think El is the god Saturn.

Or: Maybe Enlil evolved into El?

Enlil:

- God of wind, air, storms, and authority
- Often seen as a chief executive authority figure among the gods
- In some myths, he is responsible for ordering the great flood

Enlil = Zeus, Thor, Uranus?

More snakes:

Superman's birth name is Kal-El. And you know the "S" symbol stands for "snake." It clearly looks like a snake if you look at the first depictions of the symbol; the snake even has an eye. The Reptilians infiltrated Atlantis, and the good symbols turned into snake symbols. The "El" is the Elohim. And El in the Bible clearly has snake symbolism all over it with the seraphim.

More cubes:

The AllSpark = the Freemasons telling us hidden truths through movies. What I mean is, the cube has been a longstanding mystery

linked to creation. This is seen in the Superman revival scene too, where we once again meet the mysterious box. The box has the power to reinstate anterior particle relationships, which is basically my idea of free energy. See *Zack Snyder's Justice League*. So the mystery of the cube is the “64-tet” or tetrahedral packing, because it can **look cube-like**, and it contains, as I argued, life itself in one package.

Spiritual corruption:

“Egypt, a great center of learning and the birthplace of many arts and sciences, furnished an ideal environment for transcendental experimentation. Here the black magicians of Atlantis continued to exercise their superhuman powers until they had completely undermined and corrupted the morals of the primitive Mysteries. By establishing a sacerdotal caste they usurped the position formerly occupied by the initiates, and seized the reins of spiritual government. Thus black magic dictated the state religion and paralyzed the intellectual and spiritual activities of the individual by demanding his complete and unhesitating acquiescence in the dogma formulated by the priestcraft. The Pharaoh became a puppet in the hands of the Scarlet Council—a committee of arch-sorcerers elevated to power by the priesthood.”

This quote is from “*The Secret Teachings of All Ages*” by Manly P. Hall.

The cuboctahedron has this dodecahedral phase, and from the dodecahedron spring our five fingers and five toes, along with our two arms, two legs, and one head. Convergent evolution is true.

Plato associated the dodecahedron with the “shape of the cosmos” or the heavens. My idea is that, if space is dodecahedral, then humans, being reflections of space, would therefore have five fingers. In this sense, evolution did not “make” five fingers; it only worked with—or shaped—what was already implicit in the belly of the system we call the cosmos. Perhaps evolution would have eliminated a finger instead, if it could. Life, then, embraces the 5.

Some physicists have explored the idea of a dodecahedral universe, notably the Poincaré dodecahedral space model.

Humans are therefore not an accident of evolution. Rather, our geometry is eternal and embedded within eternity itself; **we were always meant to be.**

More:

The cuboctahedron is the only thing that ties the knots together and explains such secret doctrines as the 7, the 12, the 64; the 72

powers of God, the 24 elders, the 22 letters; the four elements, the perfect 10, and so on. The cuboctahedron is the only thing that can explain the I Ching, the Kabbalah, Metatron's Cube, and the Greatest Name of God. It is the solution to the Book of Revelation. In short, it is the great Masonic secret. If Isaac Newton had access to the internet in his time, we would have free energy by now.

7 = The Seed of Life, which is essentially a cuboctahedron in 2D.

12 = the vectors that make up the cuboctahedron—the 12 “Devil’s graveyards.” Now you understand that the Bermuda Triangle is a giant vector into the heart of the Earth; that is, the Earth is a giant cuboctahedron.

64 = a cuboctahedron embedded within another cuboctahedron.

72 = Nassim Haramein relates this to Kabbalah, and the answer is 64—that is, the cuboctahedron. Eight Trees of Life $\times$ nine Sephiroth (one Sephirah does not count, as it is the root or crown) = 72.

See: *LamatX: Nassim Haramein - Tree of Life*

24 = the missing tetrahedra needed to complete the 64.

22 = the 22 letters + 10 Sephiroth (in Kabbalah) = 32, which is half the code. The full code is 64.

4 elements = embedded within the folding of the cuboctahedron.

The perfect 10 = if you form a large tetrahedron from 10 points on the ground, you will quickly see that more tetrahedra can be added to form a 3D version of the structure. You then obtain 20. This is half the mystery. This is the Father. The Mother is the same, but reversed. Thus: $20 + 20 = 40$. Add the missing $24 = 64$.

KinG

King = Kin G = related to God. “King” may be a name that symbolically relates him to the gods, the ones with the knowledge of the **G**. You see this in Freemasonry as well. G stands for God, which is Geometry. Or, if you are into conspiracy theories, Genesis—as in, the gods created us, or at least genetically modified us. But I’ve come to believe that these gods were not extraterrestrials but advanced humans from an inner Earth civilization. And I believe some of them founded Atlantis. Atlantis = utland? As in “out land,” the land “out there.”

These Atlanteans are often depicted with long beards and hair. Maybe this is because they consumed the Philosopher’s Stone to gain longevity, and the stone is so potent that your hair and beard grow rapidly, making it a hassle to keep them trimmed. So you simply adopt long hair and beards as part of the culture. Then the Vikings may have mimicked that style, because you can clearly see signs they had con-

tact with Atlanteans in the past, especially if you look at the esoteric knowledge the Vikings carried.

The Dollar Bill

The pyramid is a reference to the Great Pyramid of Giza. The All-Seeing Eye sits inside a triangle, which is often interpreted as a reference to the Philosopher's Stone. God is depicted as a triangle. This is understood as knowledge that all is mental.

"Annuit Coeptis" = 13 letters. Actually 12, if the Æ is counted as one letter. This is the cuboctahedron.

Annuit comes from annuo, meaning "to nod," "to assent," or "to favor."

Coeptis is a plural noun meaning "undertakings," "endeavors," or "beginnings."

To me, it means: a new Atlantis is born.

Further, Novus Ordo Seclorum is a Latin phrase that translates to "a new order of the ages." So together: a new Atlantis is born and will come to rule.

13 steps in the pyramid = the cuboctahedron (12 vectors + 1 center).

The spiderweb represents the negative space in the isotropic vector matrix, that is, the octahedrons.

Metatron's Cube (the isotropic vector matrix) = sacred geometry = cuboctahedron.

The **isotropic vector matrix (IVM)** is a 3D space-filling geometric lattice—championed by Buckminster Fuller—where all vectors are of equal length. **Metatron's Cube** is a 2D sacred geometry symbol derived from the Fruit of Life that contains all five Platonic solids. Together, they form the structural and metaphysical foundation of the universe.

The 12 spiderweb lines represent the cuboctahedron.

(Eagle = Phoenix (fire = triangle)) + the All-Seeing Eye (triangle) = Star of David = male and female = the dual torus = creation.

- Right = Ra (sun)
- Left = Horus (moon)

So if the eagle shows the left eye and the All-Seeing Eye represents the right eye, then together they form yin and yang, father and mother, the Star of David.

9 feathers. 9 sephiroth per tree $\times$ 8 trees = 72 bricks (in the pyramid): see Nassim Haremei's work on the Kabbalah.

- 13 steps on the unfinished pyramid
- 13 stars in the constellation above the eagle
- 13 vertical stripes on the eagle's shield
- 13 arrows clutched in the eagle's left talon
- 13 leaves on the olive branch in the eagle's right talon
- 13 olives on the olive branch
- 13 letters in the Latin motto E Pluribus Unum

So it appears that 13 appears seven times. To me, 7 represents the Seed of Life. Also, the "Seven Seals" most famously refer to the symbolic seals in the Bible's Book of Revelation, which protect a scroll containing God's end-time judgments!

Some also say the number 13 is repeated 13 times on the dollar bill.

E Pluribus Unum is a Latin phrase that translates to "Out of many, one." To me, this represents the 12 vectors that form the oneness of creation: the cuboctahedron.

And who is the Green Man? Osiris. And Osiris was cut into 14 parts. You can find the 14 around the 13 stars in the constellation above the eagle. And 28 lines between them again. This may allude to the Moon.

- 28 = full lunar cycle (rounded)
- 14 = half lunar cycle

This fits with Horus, who is the reborn Osiris. Left = Horus (moon).

Horus is primarily a falcon, not an eagle. However, the eagle in the seal somewhat resembles a falcon. It may also represent a phoenix.

Roll up the money (Green Man) and face the truth!

And a hidden “owl”?

To me, the one-dollar bill contains a lot of esoteric knowledge (owl) about the structure of the universe itself. I do not accept the mainstream explanation.

Magic

What is magic? I see it as the Philosopher’s Stone—not literal magic, but a technology our ancestors mistook for magic because they could not understand the ways of the gods. The gods = members of an inner Earth civilization living among them. Or perhaps the gods walking among us were the Atlantean gods, who themselves were descended from, or originated in, this inner Earth civilization.

But there is another form of magic, and this form is hidden in the word “spell” itself, hinting at the idea that magic is rooted in words, memes. So how does this magic work? Spelling is not simply correcting words; no, it is literally magic—you cast a spell. This may come from the idea that idealism is true and reality is mind itself. So some form of logos is already there at the beginning of time. “In the beginning was the Word.” So, what’s going on here?

What’s going on? To be honest, I have no clue. This is one mystery I have yet to crack, but I think you should start with *Jordan Maxwell* and, perhaps, *Michael Tsarion* in order to explore it. Philosophically, I have argued that God exists, meaning existence already contains a highly complex mind and, if this is true, reality could be so evolved by now that you can literally shape reality with words, as if the cosmic mind is using language as a creation tool—something Terence McKenna also encountered in his DMT experiences, where the “fairies” tried to teach him to form reality using words, essentially to create things with language.

Read: **True Hallucinations: Being an Account of the Author’s Extraordinary Adventures in the Devil’s Paradise.** It recounts Terence McKenna’s 1971 expedition into the Colombian Amazon with his brother Dennis (and others), particularly their experiences at La Chorrera.

In his DMT accounts, he repeatedly described entities—his famous “machine elves”—apparently producing visible objects through vocalization. He interpreted what they were doing as an attempt to teach him to do the same thing. In *The World and Its Double*, he says the entities seemed to “use language to condense visible objects out of the air,” which he took as suggesting that **“reality is made of language.”**

He gets even closer to this idea in his *Alien Dreamtime* talk, in a section appropriately titled **“Speaking in Tongues.”** He describes the entities instructing him to use his voice to make an object. He then gives his interpretation:

“the real secret of magic, is that the world is made of words”

He goes on to say that if you knew the words from which the world was made, you could make the world into whatever you wished!

And I know the “gods” of the past—Inner Earthers or Atlanteans—were heavily into DMT because you can tell ayahuasca itself was a gift from the gods to man. So, if the fairies told McKenna that the world was made of words and tried to teach him, maybe the fairies taught the gods too, and they succeeded—or at least succeeded enough to create an entire science that we call magic.

Well, sound may shape reality, and if the universe is hyper-real, hyper-mental on higher planes, then words—what we say—could create reality. Maybe this is the hidden secret? So imagine an inner Earth civilization discovering this fact and using it as a tool themselves. So wizards and casting spells might be more than just fiction.

Again, let it sink in: Wizards and their spellcasting might be more than just fiction. I mean, imagine it! It was a different world back then, huh? I mean, we all watched *Harry Potter* and thought, “Man, school would be cool if it worked that way.” Plot twist: maybe it did—back in the day.

In sum: So maybe our words rise up to a hyper-real state, where **things** get created and slowly find their way into our reality again, which would mean that even our words create reality over time. How-

ever, this is just my wild musings. By “things,” I don’t necessarily mean objects or physical entities.

He-Man

A hidden anagram? Earth = heart.

When the alpha (H-eart) becomes the omega (eart-H).

Maybe our Earth sits at the very center of the cosmos after all, and maybe He-Man, the alter ego of Prince Adam (hint hint)—the crown prince of the magical planet Eternia—is hiding a forgotten truth. I believe Freemasons had a hidden hand in its creation. Esoterically, He-Man checks all the boxes.

Eternia = the center of the universe, and some say He-Man’s power is drawn from it, just like I envision our Earth growing, making matter—this unlimited free energy driving the cosmos. **He-Man’s power is real!** This is not fiction but hidden truth.

“According to *The Search*, Eternia is at the center of the universe.”
From: **Eternia | Wiki Grayskull | Fandom**

If Castle *Grayskull* is not alluding to alchemy, then I don't know what is! I mean, you can't get more obvious than that without spoiling it.

Also: "In most continuities, Eternian civilization is founded upon the remnants of an older society that possessed advanced technology and powerful sorcery."

This is just like Graham Hancock's lost civilization.

In my mind, they also allude to the Atlanteans making the Great Pyramid: "Eternia's ancient civilizations, such as the Osirians, possessed very advanced technology, and left many ruins and artifacts behind."

And basically David Icke's conspiracy theory of the reptilians—they also say they were real: "Preternia was menaced by King Hiss and the Snake Men until the Ancients imprisoned them in another dimension."

Imprisoned in another dimension? No—coming from another dimension!

And He-Man's main symbol reminds you of the swastika, which represents the four elements, which is a way of saying we are the masters of the universe; we know how the universe is put together and we can control its power.

But how can our Earth be at the very center of creation? I think Donald Hoffman's interface theory can begin to answer this. That is,

our universe is a user interface, so why wouldn't you put Earth at the center? Then we have the "axis of evil" in cosmology, which supports this, although physicists dismiss it, meaning they interpret the facts through their own biased framework.

Who are the six Sages in The Legend of Zelda: Ocarina of Time?

In the game, they are: Rauru (yellow), Saria (green), Darunia (red), Ruto (blue), Impa (purple), and Nabooru (orange). But there are actually seven Sages: *Zelda* (white light) is also included.

In reality, they are the *Seed of Life*:

Rauru — Mind Stone or Light Medallion. I believe this represents the cuboctahedron itself. In both *Zelda* and *Marvel*, this object holds a special place. In *Zelda*, it is the first medallion Link obtains after pulling the Master Sword. In the *Marvel* universe, a similar concept appears as the crown jewel of the Infinity Gauntlet. (Timelessness.) (Hera / Zeus.)

Saria — Time Stone or Forest Medallion = Earth/hexahedron (cube), the first stage within the cuboctahedron. (Gravity.) (Demeter.)

Darunia — Reality Stone or Fire Medallion = fire/tetrahedron
(physical matter). (Strong force.) (Hestia.)

Ruto — Space Stone or Water Medallion = water/icosahedron.
(Weak force.) (Poseidon.)

Nabooru — Soul Stone or Spirit Medallion = air/octahedron.
(Electromagnetism.) (Zeus.)

Impa — Power Stone or Shadow Medallion = aether/dodecahedron.
(Life / the humanoid.) (Hades.)

Putting these pieces together, you get a spooky retelling of actual reality, which I don't believe is coincidental, with the Mind Stone being the highest principle—literally reality starting with mind, as in idealism. This is the knowledge of an inner Earth civilization. The Time Stone tells of the beginning of time with gravity. The Reality Stone fits perfectly with physical matter (tetrahedron), and so on. Kinda spooky, actually.

Also: There are three male and three female figures in both, if Impa is interpreted as male, or Ruto as unisex. But there must be an equal balance of male and female, yin and yang—at least if this is the secret doctrine of the dual torus being presented to us by Freemasons or some other secret organization.

The whole thing is based on the Platonic solids and the colors of the rainbow. Also see the chakra system.

But you can see how the whole of Greek mythology tells the generation of one cuboctahedron to the next, describing the genesis and growth of spacetime through stories that people could relate to. Imagine an inner Earth civilization explaining how the universe is put together, but our ancestors could not understand it, so they (the inner Earth people) encoded the truth through symbology and geometry instead.

And if the Sun was birthing our planets, and they came in pairs, then perhaps the generation of gods is also a reflection of the birth order of the planets themselves!

- Jupiter ↔ Saturn (both gas giants formed in outer disk)
- Uranus ↔ Neptune (ice giants, similar evolution)
- Earth ↔ Venus (similar accretion zone, similar size)
- Mercury ↔ Mars (smaller rocky remnants)

The Triforce

The symbol of the Triforce is very ancient. It is not something Nintendo created.

When you fold the cuboctahedron, you get the tetrahedron and, if you keep folding until you reach a 2D state, you literally get the

Triforce. If the cuboctahedron was the geometrical key to the universe and could explain the origin of time itself (it can), then if I were the leader of a secret society, I would use the Triforce as my symbol to hide the cosmic secret in plain sight.

They say Nintendo got the Triforce from the Hōjō clan, but have you stopped to think where they got it from—and so on? **Keep digging.**

Here is my own philosophy for trying to understand the cuboctahedron:

A ray of light sees how it all began.

The Vector Equilibrium

“The vector equilibrium is the zero point for happenings or nonhappenings: it is the empty theater and empty circus and empty universe ready to accommodate any act and any audience.”

— R. Buckminster Fuller

The vector equilibrium = the cuboctahedron

This quote just solved for me the puzzle of how you get *something* from **nothing**—that is, nothingness is all there is, and the something is the disturbance in nothingness. But later I drew a line distinguishing the concept of nothingness from that of nonexistence. In my mind, they are not the same. Later I updated my concept of nothingness and called it timelessness or motionlessness instead, to more accurately reflect what it is and to avoid causing confusion. But I still believe that this is the **real nothingness**, the grand death at the beginning of time. This is what death is, and not even entropy and matter can survive it. (This grand death is where new life comes from, and I think that's why death is alchemy's main symbol—and perhaps why we get Castle Grayskull in *He-Man* and the human skull in alchemy.)

“The Vector Equilibrium, as its name describes, is the only geometric form wherein all of the vectors are of equal length. This includes both from its center point out to its circumferential vertices, and the edges (vectors) connecting all of those vertices.”

—<http://cosmometry.net/vector-equilibrium-&-isotropic-vector-matrix>

The only: This tells me that the cuboctahedron is “the key to everything,” the geometry we have been searching for—the chosen form that stood apart above all others, radiant and complete. And like Lucifer, the bearer of light who fell from heaven, it is cast down into the fabric of the material world, becoming the hidden architecture of reality itself.

“As has been stated throughout this website, the Vector Equilibrium (VE) is the most primary geometric energy array in the cosmos. According to Bucky Fuller, the VE is more appropriately referred to

as a “system” than as a structure, due to it having square faces that are inherently unstable and therefore non-structural.”

—<http://cosmometry.net/vector-equilibrium-&-isotropic-vector-matrix>

“Due to it having square faces” tells me the cuboctahedron is meant to fold, meant to spin, meant to be eternally in motion, and what sets this motion going in the first place is also resolved by the geometry because “eternal motion” is already in perfect balance; thus, it doesn’t need to be set into motion because it is not “moving in the classical way from A to B.”

“Because of the fundamental nonsimultaneity of universal structuring, a single, simultaneous, static model of Universe is inherently both nonexistent and conceptually impossible as well as unnecessary. Ergo, Universe does not have a shape. Do not waste your time, as man has been doing for ages, trying to think of a unit shape “outside of which there must be something,” or “within which, at center, there must be a smaller something.””

—[https://en.wikipedia.org/wiki/Synergetics_\(Fuller\)](https://en.wikipedia.org/wiki/Synergetics_(Fuller))

Meaning that the fundamental building block of the universe may be the size of an atom or a galaxy! Size is irrelevant; what matters is form.

This next quote was transcribed by me and taken from Nassim Haremein’s film ***Black Whole:***

The force of a vector is its length. When two vectors are driven against each other in opposite directions, equilibrium is achieved—or, in my language, timelessness.

“But this will be unstable equilibrium, because any other force in any other direction can break the balance. You could add two more vectors at 90 degrees from the initial point, but in that case, the edge vectors that contain the geometry will be longer than the vectors to the center, creating instability. Fuller realized that the edge vectors and the vectors to the center have to be the same distance; this creates a hexagon—or, in three dimensions, a cuboctahedron; or vector equilibrium. From this, Haramein concluded that this structure must be the geometry of the vacuum, since in perfect equilibrium, all the forces would cancel out and appear to us to be empty space.”

This quote makes it clear to me that existence must begin with the cuboctahedron; nature had no choice in the matter.

In the end, how confident am I that the Philosopher’s Stone is the cuboctahedron? I am 100% confident, because Manly P. Hall gives me the indication that there must have been a lost civilization from which this knowledge originated, and Nassim Haramein helps solve the mystery of the Kabbalah. According to him, the solution to the Kabbalah is the cuboctahedron (so I’m not the only one saying the cuboctahedron is the solution to all these ancient riddles). So all of this occult knowledge seems to have the cuboctahedron as its root symbol, and when reading these quotes we can begin to understand *why*—because neither man nor the universe had a choice in the matter. The cuboctahedron is *it*. The day science uses it as a base, I bet we will be darting around in what we call UFOs in no time.

And “sum to zero,” making the vectors align, is the key to unlimited free energy, because now we summon the *Grim Reaper* himself to bring about the death of entropy and thereby give new life to the cosmos. You see, matter was not created in the Big Bang. Matter is being continuously created (and continuously destroyed). Our planet creates matter, so yes, our planet grows. There was no Pangaea.

Note: By “created” and “destroyed,” I mean that entropy is reset. This is a transformation, not ultimate destruction. Nothing can return to nonexistence and then spring up from nonexistence. Nonexistence is impossible, or more accurately, nonsense. This is simply a transformation.

The 12 (or 13)

You might say: The 12 is simply the zodiac (12 months in a year, 12 hours on a clock); that’s why it is replicated everywhere—they wanted to preserve knowledge of it.

My reply: No, the zodiac is based on an even deeper mystery. It makes no sense why you would preserve only exoteric knowledge. No—the real hidden gem is esoteric: the true knowledge of the gods,

a knowledge so powerful that you wouldn't believe it until you witnessed it.

This is something you would preserve and replicate the symbols of *ad infinitum* and *ad nauseam*.

So let's dive straight into the coven.

The coven of witches, for example, is traditionally 13. Actually, you have $12 + 1$: 12 beams + 1 center = the cuboctahedron. Thus, the number 12—and by extension, 13—is the esoteric mystery.

12 Knights of the Round Table + King Arthur (1).

12 labors of Hercules (1).

Odin (1), the chief god, had 12 sons. (I remember reading somewhere that Odin had 12 sons, but I can't remember where.)

The Olympians, who comprised the whole pantheon (which is also a temple), were 12.

In Judaism and Christianity, the number 12 holds a special place. 12 sons of Jacob, 12 Days of Christmas, 12... There is a reason why these myths and tales are so popular. Jesus (1) and his 12 disciples. The list goes on...

You might say: But you are so selective! What about the movie Ocean's Twelve, or 12 Monkeys? Or the 12 characters in Street Fighter?

My reply: Really? Am I being selective?

Selective would be Thor's 12 sons, King Barthur and his 12 Knights, Judas and his 12 disciples, or perhaps all the lesser gods not included in the pantheon. Forget Hercules—what about Steve's 12 labors? Or 11 months in a year? What about the...

Am I really being selective? *Really?*

I take only the cream. I'm not selecting anything!

The Cream of the Cream:

The Statue of Freedom atop the U.S. Capitol dome stands on 12 pillars. Above them, 12 fasces (arrows) hold up the globe—the world. To me, this once again symbolizes the 12 vectors (arrows) of the cuboctahedron.

And our Earth itself appears to contain these 12 vectors as well: the 12 “Devil's Graveyards.”

Precision Vases

“*P*recision vases” refers to a controversial set of ancient Egyptian stone vessels.

But weren’t the Naqada the first to have these vases? Yes. But then they say: “There is a gradual development curve, not a sudden invention.” I call absolute BS. They could have inherited the really good, precise vases and then tried to replicate them, so it looks like evolution. If it was evolution, why didn’t later Egyptians make such fine vases?

Then we get: “Elite workshops could make precision stone vases, but the cultural demand for them dropped.” I say BS again. Elite workshops could make precision stone vases? Could? This is mainstream’s main line: explain-away instead of explaining. Indeed, explain-away instead of explaining, like the “devolution” of pyramid building after the three Giza pyramids. You can always—and I repeat **always**—explain things **away**, and this is mainstream’s bread and butter.

So let me get this straight: Naqada could make precision stone vases that we have a hard time doing today and cannot replicate convincingly. The later Egyptians never did it, but mainstream maintains they “could,” as if that is evidence of anything. So the more advanced group—the Egyptians—did not do it, and the less advanced group living in primitive buildings did make something truly advanced, yet failed to apply their advanced skills anywhere else, including making homes.

It makes no sense!

What makes sense is that these vases were heirlooms. I’m not saying computers made them; I’m saying they were made by, I think, the Atlanteans, using sacred geometry.

Again, these vases were not produced by machines, but by humans. But which humans? That is the question.

Look at me, I live in a reed house, and I can make vases better than people with computers!

Look at me, I live in a mudbrick home, and I can make vases better than the people who built pyramids.

And no, I’m not actually mocking the Naqada people. I’m mocking the mainstream’s ability to reason—because apparently, they have no ability to reason.

The Aztlán Stones

See: **ALIEN JESUS? The Mysterious Mexican Pieces That Challenge History**

From: **AlienCarvings**

<https://aliencarvings.com/>

The Alien Stones of Ojuelos: Real, Fake—or Both?

Among the strangest artifacts associated with Mexico are the so-called **Alien Stones of Ojuelos**, also known as the Aztlán Stones. They allegedly come from the area around Cerro del Toro, near Ojuelos de Jalisco, and depict imagery that, to modern eyes, can look astonishing: strange humanoid beings with enormous eyes, flying-disc-like objects, unusual astronomical symbols, and scenes that some researchers interpret as interactions between humans and non-human beings.

Mainstream skepticism has a straightforward explanation:

Mainstream/skeptical interpretation: *The spectacular alien/UFO pieces are modern creations without secure archaeological provenance.*

And there is an obvious reason for skepticism: **fakes exist. Lots of them.** Once unusual artifacts become valuable to collectors, there is an enormous financial incentive for people to manufacture copies and sell them as genuine antiquities.

But what if that isn't the whole story?

The Alternative Interpretation

There is an alternative research camp arguing that at least some of the objects deserve serious investigation.

Researchers Alberto Donini and Tomas Hrico traveled to Cerro del Toro in 2025 and reported personally excavating three small objects—two stone objects and one fired-clay figurine—from roughly 20–50 centimeters beneath the ground. They subsequently argued that laboratory investigation provided evidence for considerable age, particularly in the case of the fired-clay figurine. Their much stronger and more controversial conclusion is that some of the iconography could represent ancient contact with non-human intelligences.

Their work therefore presents a radically different possibility:

Alternative interpretation: *At least some specimens are genuinely ancient artifacts, and laboratory/material evidence supports that conclusion.*

This research is not presently equivalent to an archaeological consensus, and the extraordinary paleocontact interpretation remains highly controversial. But the important point is that the question doesn't necessarily have to be **“Are all the stones genuine or are all the stones fake?”**

There is a third possibility:

Some could be real, while many others are fake.

And this is where my own hypothesis begins.

My Hypothesis: Flood the Market With Fakes

I think many of these artifacts **are fake precisely because some are genuine.**

Suppose genuine artifacts began emerging that contained imagery capable of radically changing our understanding of ancient civilization. If powerful interests wanted to prevent those artifacts from being taken seriously, destroying every genuine artifact would be difficult and risky.

There would be a much easier strategy:

Flood the market with fakes.

Produce hundreds or thousands of ridiculous copies. Make them increasingly outrageous. Give some of them obvious modern characteristics. Mix those objects into the same collector networks as the potentially genuine artifacts until nobody can tell what's what.

Eventually, scientists examine some specimens and discover modern manufacturing techniques.

And then comes the inevitable conclusion:

“See? They're fake.”

Not *these particular specimens are fake.*

Not *many specimens are fake.*

But:

“The Ojuelos stones are fake.”

Case closed.

Ironically, Donini, Hrico, and Oleg Elistratov's 2026 work acknowledges a genuine problem with modern reproductions. They

argue that increased publicity and collector demand encouraged a local industry producing replicas inspired by the Cerro del Toro imagery. Their proposed solution is therefore to distinguish potentially authentic specimens from contemporary reproductions through archaeometric analysis rather than treating everything as one homogeneous collection.

That distinction is enormously important.

Finding a fake **does not logically demonstrate that every other specimen is fake**, just as finding a counterfeit Roman coin doesn't demonstrate that the Roman Empire never minted coins.

The Gatekeepers' Nightmare

My hypothesis goes one step further.

I suspect that the explosion of fakes may not be entirely accidental or motivated solely by money. I think it's possible that somebody is **deliberately encouraging or financing the production of fakes** because genuine artifacts are beginning to surface and somebody is panicking.

If that's true, the fakes aren't merely counterfeits.

They're camouflage.

You don't have to make the truth disappear if you can bury it underneath enough garbage that nobody knows which pieces are real anymore.

Of course, I cannot currently prove that deliberate operation exists. The existence of commercially produced fakes alone doesn't establish who produced them, why they were produced, or whether anyone deliberately commissioned them to discredit genuine discoveries. That part is **my hypothesis**.

But it gives us a very clear prediction.

If I'm wrong, rigorous investigation should eventually reveal that the supposedly strongest specimens are modern too.

If I'm right, then somewhere underneath this mountain of counterfeits should be a small core of artifacts that simply **refuse to die under scientific examination**.

Forget the spectacular stories. Forget the collectors. Forget the thousands of questionable stones.

Find the best specimens. Establish exactly where they came from. Excavate them under controlled conditions. Analyze the material, tool marks, patina, sediment, manufacturing technique, and surrounding archaeological layer. Send blinded samples to independent laboratories.

Because if even **one unmistakably anomalous artifact** can be documented coming directly from a sealed ancient archaeological context, the conversation changes overnight.

Maybe that's why there is so much noise surrounding these objects.

Perhaps somewhere beneath all that noise lies the **signal**.

The Fight

If someone could establish an unmistakably alien-looking specimen in an undisturbed, independently documented ancient archaeological layer, with appropriate dating and chain of custody, the mainstream forgery explanation would suddenly have a very serious problem.

But didn't Donini/Hrico/Elistratov do that?

They did.

But there's still one important difference between:

“Donini/Hrico/Elistratov have presented evidence satisfying these conditions”

and

“Those conditions have now been independently established to the satisfaction of archaeology.”

The latter hasn't happened yet—and never will. That's where the *REAL* gatekeeping comes in.

We all know the story by now. You have to be blind, deaf, dumb, and stupid not to realize that there is a genuine cover-up of our ancient past.

But I don't think the Greys are aliens. I think we can trace them to this Inner Earth civilization. Thus, the Greys are probably drones, hybrids, or AI created by them to make us think they are aliens.

Why would they do that?

Because they don't want to disclose the fact that they live literally under our feet, inside the Hollow Earth. They possess longevity technology, potentially allowing them to live for thousands of years, and you cannot simply give that gift to everyone. Their technology is also highly dangerous—potentially powerful enough to blow up planets—and you don't want surface people to have access to technology that dangerous.

We are not spiritually advanced enough for them.

So they hide behind the **“alien”** label and use it as camouflage.

3 $60/12 = 30$ days

I think this was the original plan because our universe is based on sacred geometry. Why, then, do we have 365 days? I think it is because planets were destroyed in our system. I think, basically, that *Star Wars* is a documentary of past events and that humanity was that advanced in the past. Basically, Freemasons—or someone—are telling us the truth or a distorted truth through movies. So I asked AI, and it said:

To get Earth from:

- 360 days $\rightarrow$ 365.24 days

= ~1.45% increase in orbital period

= ~1% increase in orbital radius

That implies Earth moved outward by:

- ~1.5 million km

Now ask:

Could a “huge” destroyed planet do that cleanly?

Only if:

- it had a **very close gravitational interaction with Earth itself**

Miscellaneous

Coda

From Light's Point of View

Time began
from light's
point of view.

Fairyland

The following is taken from my first book, *Fairyland*.

A Word on Gravity

Gravity is the torus-flow, plain and simple. There is no such thing as “mass.” There is only speed/velocity. When you drop a book on the floor, the reason it falls is the same reason a paper boat flows with a stream of water when you place it upon that stream. When you hold the book in your hand, you are preventing it from flowing with the universal torus flow. When you release it from your grasp, it simply moves down with the stream, which you call “falling.”

And there is another component: the torus bends spacetime naturally. That is, our torus bends spacetime into a singularity with no effort. That is what it is, and has eternally been: a dual torus. The dual torus comes formed like that. The stream of water—or torus-flow—is directed here naturally. No mass needed.

The cuboctahedron collapses, producing the tetrahedron. This causes a huge spin. This spin can then spin around itself and return to its source. In one direction, things flow out. In the other, things must flow in. Thus, in a single point, you get both attraction and repulsion. The arrow never changes direction.

The Problem With Einstein:

In a sense, Einstein used gravity to explain gravity. Our sun bends the space fabric, and our Earth revolves elegantly within this fold. However, what is it about the sun that has the ability to bend space-time? Answer: mass. Okay. But what is it about mass, then? Answer: it is heavy. Okay. What is this “heaviness”?

Maybe I am just ignorant, but I do not believe this question has been satisfactorily answered.

“Heaviness” cannot simply be a property of an object, because then the explanation becomes circular (infinite regress). We have the Necker cube. If space is actually 3D and not merely an illusion of 3D, then we have a problem. If space were truly 3D, then the lines in the Necker cube must also be 3D. And then the lines that make up those lines must also be 3D, ad infinitum. And there is certainly no “mystery mass” to be found within this infinite regression of the Necker cube.

I believe the physical sphere is very simple (due to the lack of evolution in the cosmic dawn), and that our universe is the result of revolutions of, so to speak, simple/basic motion. Thus, our planet revolves around the sun (or vice versa) like a flying cow in a tornado!

Fi fy fo fum!

The golden ratio/phi is how nature divides, from galaxies to atoms. Look at your ear. A galaxy is a dual torus. An atom is a dual torus. The difference is size.

Phi = the golden ratio.

After the fall of the cuboctahedron, a tetrahedron is left: the **Phoenix**. This tetrahedron becomes the new building block of a new cuboctahedron. But this one is smaller in scale (that's my guess, but it could be the other way around). Then this new cuboctahedron collapses, giving birth to yet another smaller (bigger??) tetrahedron, and so on. This process produces everything from galaxies to atoms.

What is the golden ratio, or phi, really? It is our fractal reality—that nature is divided in such a way that the part is always a replica of the

whole. And so it must be, because after the fall of the cuboctahedron, you produce yet another cuboctahedron, *ad infinitum*. It is always a replica of the whole because the same geometry repeats after each “fall.” It is like Russian dolls. And the “part of the part” is always a replica of the part, which is a replica of the whole.

This is why we are all one—oneness. This is what evolution really is. Every rock, insect, animal, and leaf is a mini-universe. That is how nature divides. If you have ever seen a Mandelbrot set, then realize: your coffee cup is composed of trillions of universes. Nature cannot use any other model. This is the holographic principle. We live in a holographic universe. The particle contains the universe.

This replication is the folding of the cuboctahedron into a tetrahedron, *ad infinitum*. But the golden ratio is not perfect. Nature is not perfect. Nature utilizes the Fibonacci sequence, and that is why everything in nature is divided in the image of phi. Phi was the prime mover.

Pi is the ratio of a circle’s circumference to its diameter. This can be seen if you draw a line from the center of a circle to its edge. You start with the line pointing downward (A). Then you roll the circle forward. When the line has completed one full rotation on the ground (B), you have pi between points A and B. Basically, pi is what a circle is.

That is, if you have an infinite line, what is the smallest amount of line-stuff you need to take from it to form a circle? Exactly: pi. Pi is simply a circle.

The secret relationship between pi and phi is this: in order to make a new cuboctahedron out of a new tetrahedron, you need another tetrahedron in reverse. This becomes the Star of David. Together, these tetrahedra produce a new cuboctahedron. But the key point is: the two tetrahedra must form a perfect circle in order to generate the new cuboctahedron.

Without pi, phi is impossible.

Now you know what a “phi-losopher” is.

It is all an inner, beautiful relationship.

It is all about making pi or phi—that is, pi plus the time component.

Evolution is a game. And the game is called pi.

The true goal of the original “phi-losopher.”

The womb is the Stone, and it divides according to phi. Hence: “phi-losopher” and his Stone. This divine dividing is the Fall of Lucifer. It is how galaxies divide into ever smaller parts like atoms.

The Fall of Lucifer is the separation of the universal torus into ever smaller scales, from universes to quarks. Phi ensures that the quark is a miniature version of the universe. Each division is a complete torus; that is what phi means. The whole of the miniature contains everything. Again: This is the holographic universe and the saying “as above, so below.”

So when you see a pine cone lying on the ground, pick it up and muse: “This is just a minifigure of the forest.” Not only the forest—the cone also contains the whole universe. Just like a cell in your body contains the whole of you.

And pi (not to be confused with phi) is when the Father and Mother come together, producing the cuboctahedron (i.e., the World Egg, from which the universe emerges). The cuboctahedron then folds, producing the Child: everything from the universe to the quark, with the aid of phi. Each iteration repeats the same process on a smaller scale—like Russian dolls. If you make one, you must make a smaller one next, or they will not fit together. This also creates distance.

Phi is like the octave on a piano. Each octave contains the whole. The Fall of Lucifer, therefore, is when you move “down” (higher) on your piano.

All is about the pi/phi relationship. Cosmic sex.

The end product of the pi/phi process, or timelessness-production, is love (see my spiritual side).

How Many Times Have I Incarnated?

If idealism is true and universal consciousness has existed forever, does it have an infinite past?

My take:

No. First of all, universal consciousness exists in timelessness, and yes, that is possible because timelessness is not static but contains motion—real motion. But there is no past, and memory/history does not extend infinitely backward. The timeless system is the dual torus, and the dual torus contains the cuboctahedron, which in turn represents true death. So, death is the logical starting point of the system.

You cannot go beyond it (death) because it is already perfect balance. Going beyond it would be like trying to create a balance more perfect than perfect balance (the cuboctahedron). It cannot be done. So you cannot have a history that goes beyond this point either.

However, in this framework, life and death are two sides of the same coin. It is not that universal consciousness arose from death; rather, death coexists with life. Life can be understood as the torus feeding back into itself, becoming self-aware, while death is a state within this system. But death is never permanent—it breathes new life into life by dissolving the old, as described elsewhere in this work.

How many times have I incarnated as a human, and what did I do before that?

My take:

I think there may be a way to find out. Perhaps when we die, we will discover how many times we have been a human soul. Before that, we were the cosmic mind or universal consciousness, and one day we will return to being that cosmic mind.

What did the cosmic mind do before eternity?

My take:

Again, the realm that the cosmic mind occupies does not have linear time, so the question is misdirected.

That said, I know what the question is set up to do, which is to make immortality seem absurd and impossible, meaning materialism must be correct, right? No. I believe idealism is correct, but I'll admit, the moment I really try to wrap my head around eternity, my brain starts to melt.

My View on Aliens

I first believed in aliens because I couldn't explain all the advanced technology and occult knowledge of the past without them. But Manly P. Hall insisted that they are not aliens! I finally listened when I discovered Donald Hoffman and his interface theory, because it allowed me to reframe Fermi's paradox: our universe is like a fishbowl, and there are no sharks in it.

But that doesn't necessarily mean there are no sharks (aliens)—so where are they?

I then discovered the inner Earth civilization, and this gave me a logical explanation for UFOs. I learned where the sharks are: in another dimension, trying to hack into our reality or interface. The so-called **Reptilians**.

I believe this to be true, so I still believe in aliens—but not *space aliens*.

And no, I don't think aliens made the Great Pyramid. I believe that was the work of the Atlanteans.

But sure, I've believed in the existence of space aliens for so long that some part of me still believes they're out there. But let's be real: how the hell do you solve the Fermi paradox, then? I don't think you can. That is to say, if there really were space aliens out there, they'd be *here*, we'd know about it, and the government would be panicking! And my guess is, the reason they're not panicking is because they already know who's flying these things: **humans from Inner Earth.**

Nonexistence

The following may repeat parts of my philosophy, so I apologize for that. However, I felt it was important to include it once more.

Negation

If you can show that negation is only part of the logical system, and that the logical system itself is a fabrication of the human mind, then you have shown that nonexistence cannot be fundamental.

But I am saying something stronger than you might think.

I am attacking the legitimacy of negation itself as an ontological operator.

That is, negation is not built into reality itself. Negation is a feature of human conceptual modeling. Therefore, the entire idea of "nonexistence" is downstream from an artificial symbolic framework rather than something discovered in reality.

This is a much stronger claim because I am not merely saying,
"We cannot imagine nonexistence."

I am saying,

"The very mechanism required to formulate nonexistence is itself
invented."

So the structure of the argument becomes:

1. Logic is a symbolic abstraction created by the mind.
2. Negation is a rule within that abstraction.
3. "Nonexistence" depends entirely on negation.
4. Therefore, nonexistence is not an independently discovered feature of reality.
5. It is an artifact generated by a symbolic game played within existence.

This shifts the debate completely.

Normally, philosophers ask:

"Does nonexistence exist?"

But my position is:

"The category itself is artificial."

In other words, existence is primary, while nonexistence is only a parasitic abstraction derived from existence through symbolic subtraction.

In my framework, reality itself never presents "nonbeing." Only minds performing conceptual distinctions create that concept.

In summary: Existence is self-evident and immediate. Nonexistence is manufactured.

Most philosophers ask:

"Does nonexistence exist?"

I'm asking:

"Why are we even allowed to use the concept of nonexistence?"

Repeat
Repeat
Repeat

The following may repeat parts of my philosophy, so I apologize for that. However, I felt it was important to include it once more.

Is there such a thing as free unlimited energy?

Yes.

Unlimited, Free Energy

This is so simple even a child can understand. Any object has boundaries that separate it from other objects. But as long as those

boundaries are there, you have infinite regress, because you can always ask where those boundaries came from. And if your answer is that they came from other boundaries, then you can, like a child, ask where those other boundaries came from. You can do this forever. And the forever part is what we call infinite regress.

Boundary = a limit; something that separates one thing from another.

So the answer is simple: the foundation of Nature is a state without boundaries. Obviously. Try to ask where those zero boundaries came from. Well, they could have always existed, because their number is zero. Yes, I'm being even more obvious.

Now, the beautiful thing here is that if you take all the boundaries in the universe and add them up, you get zero. Zero boundaries. The boundary of a boundary is zero. Sum to zero. That is the key to the universe.

What does zero mean here?

Take a piece of paper. Fold it a couple of times. Count how many times you folded it. That's it. It is that simple. Say you counted to 6. Then unfold it 6 times. What do you get? That is correct: an unfolded paper. A child can understand this.

Modern physics, on the other hand, does not understand this!! They even set the cosmological constant greater than zero! The blind leading the blind. It is as if modern physics is being pushed deliberately further and further away from the truth.

What is the truth?

The truth is that with zero boundaries, you cannot create microstates. Just try. You can't do it. And you don't even have atoms at this point. This means that, at the heart of Nature, at her very foundation, entropy must reset, because there are no microstates.

Create a microstate without time. Try!

This changes the game entirely.

Now we can access infinite energy. Not because it is infinite, but because Nature recycles matter, making it brand new again.

But you may say: even if that were true, it doesn't mean we humans can access the Holy Grail — literally, the cup that never empties.

Well, to that I say: now that you know it exists, we should at least try.

But why call this free energy?

Well, first off, it is — that is, free energy.

Second, this has nothing to do with perpetual motion machines or overunity devices. Those are still impossible because they have been defined to be impossible. Nevertheless, real free energy is possible.

It is free because Nature recycles matter for free. It does not cost Nature energy to do this, because the zero-boundary state is — that is right — a state. It does not cost energy to uphold, recycle, or anything else, any more than it costs an object already in motion to stay in motion. It is just a state.

True, it costs humans some calories to get their hands on free energy, so a skeptic might define it as not really free; but the skeptic can, for lack of more refined words, kiss my ass.

There you have it. Free energy that even a child can understand — or at least a teenager. But physicists will not understand. They would rather have infinite regress.

Look, there are only TWO possibilities here:

Boundaries forever and ever and ever — in other words, the greatest paradox of all time, for all time — which physicists are apparently fine with.

Or:

Zero boundaries. Zero entropy. Thus, the recycling of matter (free energy). A real beginning to everything.

There is no third option here, because either you have boundaries at the beginning of time, or **you don't**.

The BIG toe:

Physicists set the cosmological constant greater than zero because they observe the universe expanding. But ask a philosopher, and he or she will tell you that this may simply be because we have not yet seen the contractive side. The real number could be zero: Nature expanding and contracting at the same time.

Nature must be balanced. Period. Everything adds up to zero — boundaries, motion, expansion, everything. Without balance, there is no existence. This is not to be argued with. This is what makes arguments possible in the first place!

Yet modern physics starts with an imbalance, and then they build their house of cards. And you wonder why we haven't even seen their big toe yet. It is all a great mystery.

Physics threw philosophy out of the classroom — and with it, common sense. They promised me the theory of everything when I was young. Now I see it will never come until they restore reason and reinstate philosophy as king.

Why Science Abandoned Reason

Man is fallible and subjective. Science is objective. The problem was this: the ones who said science is **objective** were scientists (**subjective**) — and that is how it all went to hell!

When philosophers analyzed this, they saw: no, science is subjective too, and very much fallible. The scientists didn't like that very much, so they simply stopped inviting philosophers to the party — and here we are.

I mean, your face should light up with the color red when you say that the cosmological constant is greater than zero. How did it come to this? How was reason abandoned?

It was abandoned on the belief — yes, belief — that evidence is evidence of evidence, and since man is fallible, we should go with the evidence. But the philosophers analyzed this too and saw that evidence is basically crap (the problem is people mistake their subjective, biased, low-IQ interpretation of the evidence for the evidence itself), and now they definitely weren't going to those parties.

Evidence is not evidence of its own meaning. Evidence gives us facts; humans decide what those facts mean.

That is to say, evidence is never evidence of itself; evidence is always evidence of someone's bad interpretation of it.

"But interpretations aren't all bad; they can be excellent." Now you're making me laugh too. No, they're **always bad**. Just look at Pangaea. My God, modern science is stupid!

So, the philosophers concluded that the absence of evidence is more evidence than evidence ever was, and a hardcore philosopher could even dismantle the whole theory of evolution! So not only were philosophers not invited to the party, they were abandoned from the classroom as well.

The result: a modern physicist can say that the cosmological constant is greater than zero and not even turn red in the face while doing so, because reason was abandoned — the philosophers took that with them.

Modern science in 2026: the cosmological constant is greater than zero.

This is like saying $1 + 1 = 4$. The only reason this flies is because scientists don't understand how absurd their belief is, because they never had philosophical training. Modern physics is powerful but philosophically confused.

Roger Penrose

Penrose reasoned that the cosmological constant is zero, but he was told, by the weight of evidence, that it must be greater than zero. So, he went along with it. He basically abandoned reason, and it is such a tragedy.

However, you say that Penrose revised his reasoning in light of new evidence willingly, and that I may therefore be unfair to Penrose. That may be true. But I am not being unfair to reason itself — and that is my deeper point.

If reason says $\Lambda = 0$, and observations suggest $\Lambda > 0$, then accepting $\Lambda > 0$ means abandoning reason. Someone should have the courage to stand in front of the physics community and say that the cosmological

constant is not greater than zero. You are being asked to abandon reason for the sake of evidence, and someone should call that out for what it is. Insanity.

Perhaps Penrose revised his reasoning willingly. Perhaps he believed he was being reasonable in doing so. But that is precisely the problem. If reason can be overridden by observation, then reason is no longer fundamental. It becomes secondary. And once reason becomes secondary, deeper rational structure begins to dissolve.

Some principles, like balance, should not be overridden by observation. If they are, then we lose the very thing that makes understanding possible in the first place.

Balance:

$\Lambda = 0$ need not mean “nothing is happening.” It could hypothetically represent a globally balanced system in which expansion and contraction cancel, while observers confined to the expansion phase nevertheless measure accelerated expansion.

Modern physics: **empiricism first**. And look at where we are — debating even the fundamentals. Are we getting closer to the truth, or further away? One could argue that we may be further from the truth than ever before, precisely because reason has been placed second.

Skeptic:

You say:

No time $\rightarrow$ no history $\rightarrow$ no states

But in physics:

- Microstates are not history
- They are possible configurations

My reply:

No — that is not what I'm saying. I'm saying this:

No time $\rightarrow$ no boundaries $\rightarrow$ no entropy (microstates).

Entropy is completely dependent on time. You are describing a slice of bread, a time slice, but even this is dependent on time in order to have arrived in that position.

Skeptic:

"The boundary of a boundary = 0."

Nature is not obliged to follow metaphors.

My reply:

It is not a metaphor. It is logic. You take all the boundaries in spacetime, add them together, and the result is that spacetime started without boundaries. I gave the folded-paper example.

True, physicists won't understand this, but children will — and AI too. So we just have to wait until children or AI run the future, and then we will have unlimited energy.

(**Skeptic:** Are you being polemical on purpose? **Me:** Yes, I am.)

Skeptic:

You are using time to explain the absence of time. This is a contradiction.

My reply:

NO. It is the solution to the riddle of the universe. It is how one solves infinite regress. It is brilliant. Sum to zero. Zero is hero. The true hero is zero — take your pick.

Skeptic:

There could be a third option.

My reply:

No. Entropy means death, so if Nature did not arise from literally nothing, then it **MUST** reset entropy. There is no third option.

In summa:

Either differences exist (boundaries),
or differences do not exist (zero boundaries).

Boundaries = difference = entropy

Zero boundaries = unity = no entropy

More cons: regress may be infinite without contradiction.

To that I reply: Good luck with that!

Another con:

If there are no boundaries

→ there are no differences

→ there is no structure

Then a classic problem arises:

How do you go from:

no differences

to

differences (the universe)

This is the same problem as:

how something comes from nothing

So you have not solved the problem

you have *moved* it.

To that I reply:

If spacetime boundaries can cancel, it means they can emerge too.

Like two arm wrestlers locked in a stalemate/deadlock. Say boundaries are the arms as they move about, and zero boundaries are when the arm-wrestlers are in a deadlock. Then you can see how no boundaries gives rise to boundaries, because the motion is already present in the arms, just not free.

Deadlock is dynamic (my DEMU theory)

Not static

Thus: local asymmetry can arise.

The ON Switch

You say: I understand that if all motion = motionlessness, then you don't need to set motionlessness/timelessness going because it doesn't move from A to B in extended space; it exists in a state where A is in the same spot as B and is then simply updating its state. But you can still ask: Who pushed the On switch on motion? Not what set it going in the classical sense, but what turned it on.

My reply: The analogy implies moving from A to B in order to turn on a switch, but I can understand poetically what you mean anyway, and I think the solution is that the On and Off switches, as it were, both coexist within the cuboctahedron/dual torus system, where the Off is the cuboctahedron itself and the On is the feedback loop, the dual torus. So, you don't need to turn on the switch because both (On/Off) are one system.

On = consciousness

Off = death

But you still need to ask why this system exists, and that was to solve infinite regress.

Even if you imagine a perfect space where lines cross horizontally and vertically, you can say there is no infinite regress here because everything is the same, but the lines themselves contain hidden regress because: How did they get into their position? If you want something that is more than a zero-dimensional reality, you need motion in order to unpack things. And you can't have a static zero-dimensional reality because it wouldn't contain anything; it would just be nonexistence. But motion that is expanding and contracting at the same time can be a zero-dimensional point because it is *something*. And being zero-dimensional also avoids infinite regress, which you will have if you are extended, if you are more than zero-dimensional.

But you don't need to solve infinite regress if you have nonexistence instead, but then we saw that nonexistence is just a fabrication, an artifact of a man-made logical system.

So now we are back at infinite regress, and we saw that timeless balance solves it. And if you ask why balance, you get balance back as an answer, and thus all the "why" questioning stops here, or at least doesn't go any further. And this can be seen in the cuboctahedron because you can only fold it inwards, but you cannot go "beyond" the cuboctahedron itself because it would only lead inwards again.

Timeless balance = only consciousness can function as the real "closure" of the system.

But how does this dual torus generate the universe?

And our answer was that it doesn't; rather, it is the universe. Time and timelessness are one system.

So, we have covered it all, but you can still say there must be something "more."

And I think that more is what we call evolution, which is the fact that the dual torus carries within itself this dual aspect, giving rise to evolution (replication/sex) in the first place. But the "more" is what

this ultimately produces, which is **infinite love**, which I speculate gives rise to a spiritual dimension.

And going full circle, we can understand that on a circle there is neither beginning nor end, so that the spiritual dimension was always there from the very beginning of time.

If you want to look at the beginning of time, you can sit on a ray of light in your mind's eye because **everything began with the way light views reality.**

Summary of the DEMU Idea

My proposal is that reality is fundamentally an **eternal, self-balancing system** rather than a one-time event. The universe does not begin in time; instead, it exists as a continuous process.

At the physical level, I describe this process using the concept of a **dual torus**. In this model:

- matter moves inward through regions analogous to black holes
- matter moves outward through regions analogous to white holes
- together, they form a continuous cycle of collapse and renewal

This creates a **self-recycling universe**, where matter is never destroyed but continually transformed:

formless → form → formless → form → endlessly

The Philosophical Core

The starting point of the theory is the problem of **infinite regress**.

If every event depends on a prior cause, explanation is never complete.

To resolve this:

- regress requires time
- therefore, the foundation of reality must be **timeless**

However:

- a **static timeless state** cannot generate a universe
- therefore, the ground must be **dynamic timeless activity**

This leads to the conclusion that reality is:

- not static being
 - but **self-existing, balanced motion**
-

The Role of the Dual Torus

The dual torus represents this balance:

- expansion and contraction occur simultaneously
- there is **zero delay** between them
- therefore, there is no “first moment” and no need for a starting event

In this sense:

- the universe does not begin
 - it is **eternal circulation**
-

Timeless Motion and Consciousness

Because the ground of reality is timeless:

- motion cannot “start” in the usual sense
- instead, motion exists as **continuous internal equilibrium**

This implies:

- reality is not made of things
- reality is **process itself**

From this perspective:

- the dual torus is the structural form
 - consciousness is the internal experience of that structure
-

Free Energy Concept

Within this framework, I propose that:

- matter entering the timeless core cannot retain its prior state
- because timelessness cannot contain temporal history
- therefore, matter is **reset to a low-entropy condition**

As a result:

- energy that has become unusable is restored
- the universe functions as a **cosmic recycling system**

This is not:

- a perpetual motion machine
- nor creation of energy from nothing

It is:

- **continuous renewal of existing matter and energy**
-

Conclusion

Reality is best understood not as a created system, but as an **eternal, self-balancing process**.

- It has no beginning
- it requires no external cause
- and its foundation is **timeless, dynamic equilibrium**

In short:

the universe is not something that started, but something that is.

The universe looks like it wears down, but I believe that is only half the story. I think reality has a deeper timeless layer. When matter reaches that layer, it can no longer keep the disorder it built up in time, so it gets reset and renewed. Then it returns to the universe in a fresh state. That means the cosmos is not a one-way road to death, but a recycling system. So free energy would not mean creating energy from nothing. It would mean learning how to receive renewed matter from a universe that is already restoring itself.

PMMs

A perpetual-motion machine is basically a machine that does work without a corresponding energy source. It's like baking a cake with zero ingredients, putting the empty pan in the oven, and expecting to pull out more than hot air. You can't get something from nothing.

So a perpetual-motion machine is already defined not to work from the outset! Of course PMMs don't work—we defined them that way!

And “over-unity” suffers from a similar problem. If by “unity” you mean existence itself, then you can't get “over” unity, because you can't get more stuff than existence already contains. If by “over” you simply mean getting more energy out than the energy you personally put in, then just eat a chocolate bar. You'll get far more energy into your system than the work you expended grabbing the bar from the fridge and putting it in your mouth. Of course, the chocolate itself is the energy source.

My idea of free energy is different: old matter is recycled for free by Nature, so it is neither perpetual motion nor over-unity. It could nevertheless provide effectively unlimited energy for free—not because energy is being created from nothing, but because Nature is continually recycling what already exists.

That raises a deeper question: if matter is eternal, how much stuff is there in existence, and why isn't there more?

I think the amount of stuff available in the universe may ultimately be determined by Nature's ability to close the infinite regress. If timelessness is what closes that regress, and what appears to us as timelessness is actually an extremely fast underlying spin, then the strength of that spin may ultimately determine how much can exist.

So if the underlying spin were “stronger,” Nature could sustain more manifested stuff; if weaker, less. The observed quantity of matter would therefore **not be arbitrary**. It would be constrained by the dynamical capacity of the underlying structure.

I mean, “**strength of rotation determines an energetic capacity**” isn’t inherently nonsensical. But I confess, I’m no physicist—I’m just an armchair philosopher.

But if you say my free-energy idea won’t work because perpetual-motion machines don’t work, after I’ve explained exactly why perpetual-motion machines don’t work and why my idea has zero to do with them, and you link my idea to them anyway, I swear I’m going to reach through the screen and bonk you over the head with a hammer!

My Point

- The ground of reality must eliminate infinite regress.
 - Infinite regress arises from unresolved asymmetry (something that could be otherwise).
 - A high-entropy “junkyard” state contains arbitrary, uneven distributions.
 - Therefore, it contains unresolved asymmetry.
 - Therefore, it reintroduces infinite regress.
 - Therefore, it cannot be the ground.
 - Therefore, a reset mechanism is required to restore balance.

Anything in space, whatever it is, contains infinite regress if it is not balanced. **That is my whole point.**

The Mirror

The mirror tells you the world is an illusion because right and left switch places. This means there is no objective, external right and left. Without an external right and left, you cannot have an external world, because such a world requires the objective right and left.

You might say:

"Physics works perfectly well with relative frames of reference."

You don't understand! I'm talking about the fact that you can create many worlds, so how do you get the one external world from these many worlds?

You might then say:

"Even if there are many coordinate systems, many perspectives, and many representations, they can still all map onto one underlying structure."

You still don't understand. There is no way to anchor the one external world, because it too would just be a perspective. You don't get one real world from many perspectives; you just get many perspectives!

The supposed "one world" is never actually reached. The moment someone tries to describe or identify that world, they have merely introduced another perspective.

I tell you: the mirror testifies to the fact that our world is an illusion, a user interface, as Donald Hoffman would suggest.

You then finally defeat me—or so you think:

"The existence of an objective world does not require a God's-eye view of it. The world can exist independently even if we only ever access it through perspectives."

My final reply would then be:

"Okay, tell me: is this *independent* world the right world or the left world?"

You might say:

"It's the right world, of course, because I'm right."

Is perspective fundamental, and is an objective world possible at all?

A realist would answer:

"Neither."

Because "right" and "left" are not properties of the independent world itself. They are relational distinctions that emerge from a point of view within the world.

I would say:

"That's exactly the problem!"

If the independent world is neither right nor left, then it lacks the very distinction that appears in experience. Yet every experienced world is either a right-world or a left-world relative to an observer.

So where did the distinction come from?

The realist says:

"It comes from the observer's orientation."

But then you can ask:

Is the observer part of the independent world or not?

If yes, then the independent world already contains orientation somehow.

If no, then the observer has been smuggled in from outside the independent world.

This is the pressure point I'm pushing on.

A realist can still respond that the world contains relations but not absolute directions. In modern physics, there is no universal cosmic "right" and "left." There are only orientation relations between objects and observers.

But my objection is deeper:

Every attempt to describe the independent world strips away the very perspectival features that make a world appear as a world. What's left is an abstraction, not the world we actually encounter.

And that's a respectable philosophical challenge.

The strongest version of my argument is not:

"Is the real world the right world or the left world?"

It's:

"If the real world is neither right nor left, then the real world is not the world that appears. If the real world is right or left, then it depends on perspective. Either way, the supposedly objective world seems difficult to anchor."

So: an objective world seems difficult to anchor? Yes! It is an oxymoron!

From my perspective, the problem isn't that the objective world is difficult to anchor. The problem is that the very idea of an objective world is self-contradictory.

As follows:

1. Any world that can be specified must have determinate features.
2. Features such as right/left, up/down, here/there, and before/after only exist relative to a perspective.
3. Therefore, any describable world is already perspectival.
4. An "objective world" is supposed to exist independently of all perspectives.
5. But once all perspectives are removed, no world remains to be described.
6. Therefore, "objective world" is an oxymoron: a world is precisely something that appears from a perspective.

In that framework, "objective world" is like saying:

- a color that is not visible,
- a viewpoint with no point of view,
- a map that is nowhere,
- a world with no orientation whatsoever.

A realist would challenge step 5 and say:

"The world does not disappear when perspective is removed; only the perspective disappears."

My reply:

Then show me this world. The moment you show it, describe it, identify it, or distinguish it from anything else, you have reintroduced a perspective.

So the disagreement becomes very fundamental.

The realist treats perspective as a way of accessing reality.

I say: perspective is what constitutes a world in the first place.

Without perspective, there may be something left—nothingness—but calling it a "world" is already saying too much.

In that sense, my objection is not merely epistemological ("we can't know the objective world"). It is ontological:

A world is inherently perspectival. Therefore, a completely perspective-free world is not a world at all.

That's why, from within my line of reasoning, "objective world" appears oxymoronic.

Whether one accepts that conclusion is another matter, but the argument itself is philosophically coherent.

And if you still insist on your independent world of nothing at all, one thing is certain: the mirror tells you that **this world** of perspectives is, at the very least, a grand illusion!

Mathematicians making shit up like $1 + 1 = 2$. How do you define 1? Go. I'm waiting. And I will wait forever. 1 can be carved into infinitely many pieces, so now you say infinity + infinity = 2.

You say, "1' is not a physical thing you can cut; it is abstract."

OK then, define it. No? Define it mathematically then. [Insert bs answer]. You haven't defined it, I want to know what it is.

You say: "'What it is" depends on the foundation you choose. There is no single "thing" behind 1 that exists independently of definitions."

My reply: And there we go. You borrowed 1 from the real world, e.g. this is 1 apple, etc., and failed to define it, so you moved it over to the mathematical world and cut its ties to the real world, and now you no longer know what it is.

I will tell you what it is: it is a game we invented. And we can play that game, but you can never define what 1 is other than saying it is a rule.

Yes, I maintain you cannot define what 1 is.

You say: "1 is defined as the successor of 0."

This is a bs definition; you already need to know what 1 is before you define it.

But if we cannot define 1, how can we know what it is? That is my point: we can't! What is 1? I still don't know.

If 1 is just a rule in a game, fine. I can understand rules like I play a game of chess. If 1 is a mental placeholder for objects in the real world, then fine, I can understand 1.

But if you really push it and say the universe is made of math, then I want to know what "that" 1 is, and you cannot give me an answer because the universe is not made of math. And that is my deeper point behind my rant here.

In sum: "1 has no intrinsic essence, but it is still precisely and rigorously defined within formal structure."

Yeah, until you look at it!

The Mermaid

Quantum mechanics explained: *mermaid analogy*.

If my timeless realm is real, then reality is always zero-dimensional, because on the dual torus expansion is met by contraction. So you never move outward into extension or space within whatever medium you imagine the universe to sit in. Then this medium would itself have to sit in another medium, leading to an infinite regress.

But if you stay zero-dimensional forever, then all problems are solved. Physicists use mathematical tricks to say space does not need to be contained in another medium in order for a 3D world to exist, but I think these are just ways of sweeping the real problem under the rug. The real solution is a zero-dimensional world.

So let's say this zero-dimensional world is the mermaid. From this world, the human animal mind constructs 3D reality as a user illusion (Donald Hoffman). Then we can explain how particles can be both particles and waves, and how particles can communicate instantly.

So, conjure the torus in your mind's eye. The toroidal core is the 0D world, and the torus wings are the 3D world. Now, because all

toruses in the universe are actually 0D, they connect and can share information instantly. Particles can choose to be particles or waves because the wave aspect is part of the user illusion, not the underlying reality.

So atoms are like mermaids, having their tails in the sea (0D) and their bodies above water (3D). Thus, because they are mermaids, particles can be both particles and waves at the same time.

- Particle = the form of the torus.
- Wave = the expression of the fact that all toruses are interconnected, which the animal mind renders as a wave. Both the particle and the wave belong to the interface, but the animal mind can select which aspect to manifest.

The Great Bang

The torus must be the BBB (basic building block), because the Big Bang needed to expand. There is no outside space—so what did the Big Bang expand into? The only solution is: *itself*.

Which means it needed a *form* that can do that, and that form is the torus, or dual torus.

The skeptic:

“You haven’t solved the problem of space because a torus is a geometric shape *inside* space. And modern cosmology already avoids the ‘outside space’ problem by saying space itself is what expands.”

My reply:

Not my dual torus—because in that case expansion equals contraction. So my dual torus is not inside space, because it is perfectly balanced.

And the modern claim that “space itself is what expands” is, in my view, an unresolved concept. They cannot fully explain it, so they resort to abstract analogies that ultimately undermine the idea on a deeper philosophical level.

Saying spheres are unbounded and asking us to imagine space like that—just in a higher dimension we cannot picture—fails because the analogy breaks down. Spheres themselves exist in space, which means the analogy does not do what it is supposed to do.

It becomes like asking someone to envision nothingness. In the end, it is all just conceptual scaffolding.

I mean, saying “space itself is what expands” is nonsense deluxe! It’s the cosmological equivalent of a Harry Potter tent that’s tiny on the outside and the size of a mansion on the inside—and when someone asks how the hell that works, you proudly announce, “Well, the space inside is bigger.” No shit. You haven’t explained the absurdity; you’ve just repeated it in scientific-sounding language and mistaken the re-statement for an explanation.

Nonsense deluxe = This isn't merely nonsense—it's premium-grade, top-shelf nonsense. Basically: Nonsense, but the luxury edition.

Final word:

OK, "expansion" means metric expansion, not expansion into an external container. But space is still out there, so even if it doesn't expand into something, it still sits there, so what is it sitting in? Then you say something like space is not a substance inside a box, space is the set of spatial relations, so it's like asking "What is north of the North Pole?" And now we are back at the terrible analogies that break down. So in the end we have to take it on faith that the higher dimensions really do resolve the issue by becoming, I don't know, super Klein bottles that can bootstrap their own asses all the way to bald hell to save mainstream from the obvious fact that 3D is, and will always be, an illusion. The independent world outside consciousness cannot be. **There must be a container for space.** And we have one: idealism. They just want their materialist worldview to be true, so they bootstrap it all the way to hell and back.

Modern physics = "to pull yourself up by your own bootstraps"

More:

You can't point beyond experience. We are stuck in the labyrinth of the Minotaur. This can be seen in the cuboctahedron as well: you can't point beyond the walls of the cuboctahedron. You can fold them inwards and then unfold the system again, but there is nothing beyond. So it is like a white hole that points inward, into the universe. And even if you had a black hole, it would still only lead to a white hole

again and then back into the universe again. All arrows point inward; thus, you cannot go beyond it and make sense of physicalism.

YouTube

Here are some YouTube channels I recommend, in no particular order:

- History Time
- Luke Reagen
- UnchartedX
- The Diary of a CEO
- Curt Jaimungal
- Bright Insight
- Mr. Mythos
- Paul Cook
- Lex Fridman
- Timothy Hogan
- The Why Files
- Matt Beall Podcast
- The Randall Carlson
- SPIRIT in STONE
- DeDunking
- Matthew LaCroix
- Funny Olde World

- Ancient Architects (though I tend to tune out when it becomes too mainstream)
- Universe Inside You
- Danny Jones
- Graham Hancock Official Channel
- The Cosmic Summit
- Mind Unveiled
- PowerfulJRE
- Julian Dorey
- History for GRANITE (though I tend to tune out when it becomes too mainstream)

My favorites, though, are The Why Files, Matt Beall, and Danny Jones. But check out Mr. Mythos too if you really want to go **DEEP**.

Other ones are Illegitimate Scholar, Michael Button, AlienCarvings, and the 4biddenknowledge Podcast Network (though I disagree with the idea that the Anunnaki are aliens).

There are probably channels I forgot to mention, or channels I have yet to discover and visit, but this should get you going down the rabbit hole.

And *Doom Debates* is probably the most important channel in the world right now. And **The Randall Carlson**.

Green

I think the Great Pyramid was built over 12,000 years ago, when Giza was green, which actually makes sense. Then the Great Flood came, which Randall Carlson talks about, and later the Egyptians restored the Great Pyramid before Khufu's time. But restoration takes time, so Khufu finished it and then erased past rulers to take all the credit himself. That is why the carbon dating does not match Khufu's time.

You can also see in the great stonework around the world that the Atlanteans did not use mortar. Their techniques were so advanced that mortar was not needed. So the mortar is a dead giveaway of restoration work, not original construction.

I think Edgar Cayce was spot on the first time: the Great Pyramid is much, much older. This would explain the devolution of pyramid building in Egypt, because they never had the full know-how of the lost civilization in the first place.

I mean, who the hell creates a Great Pyramid in a desert? It is so obvious that this thing was made over 12,000 years ago, when Giza was green.

Then you say, “Archaeology operates on material constraints.” No, they operate on lies. If they told the truth, they would test the Khufu graffiti, which you claim is evidence, but which is anti-evidence in reality. Because the marks were discovered under questionable 19th-century conditions, they should be treated as provisional until modern materials analysis is published under controlled access.

If you do not agree, you are not doing science, logic, or reason. Restricting access makes that provisional status persist, which keeps a potentially decisive piece of evidence from being independently verified.

So how can I support the mainstream view when they refuse to do **real** science? They refuse to test it because that is all the real evidence they have. The rest — like the Diary of Merer, the boat pits, and the workers’ village — is *circumstantial* material that would not hold up in a court of law.

They also do not let us see what is beneath the Giza plateau. They gatekeep and seal away the truth behind metal doors and bury it under sand to hide the facts. They never let us see for real.

So there is no logical way you can convince me that Khufu did it when you are an enemy of reason.

According to the mainstream view, if a vagabond pissed on my house, he made the house.

You said, “The Khufu-era evidence is not equivalent to someone urinating on the outside.” Yes, it is. All the surface-area evidence is restoration at best. You cannot logically jump from that evidence to original construction. Yes or no?

You eventually answered: “No.” Thank you. That is all I wanted to hear.

Then you say, “Old Kingdom construction is the strongest current model.” No, it isn’t. They refuse to test the graffiti, so the model is anti-scientific. Calling it the strongest model is like calling the devil a good guy. If the greatest lie in history were exposed, it would implode like a bomb.

You say, “It would not automatically prove the pyramid is 12,000 years old.” It would, because people would demand to know what lies beneath the sand. They would demand **full disclosure**.

You say, “Even full excavation beneath the Giza plateau could reveal nothing older than Old Kingdom layers.” That sounds like more lies.

Imagine the truth comes out — then you will see how weak your counterarguments have been and why I do not buy them.

You ask, “What if the truth does not match your model?” Then clowns made the universe — which is possible.

You ask whether my plausibility intuition is calibrated by data or worldview. Logic. I follow logic.

Logic says test the graffiti.

You say the chronological model does not hinge on that single element. Yes, it does. If the greatest lie in history were exposed, there would be a flood — a flood of angry people.

You say that if the mainstream had weaker evidence and Atlantis had stronger evidence, you would switch. But you are defending the devil. A real scientist — one attuned to reason — would reject the mainstream narrative on principle until real testing has been done. He would reject anti-science Egyptology.

You say I assume the model stands or falls on the graffiti. No — I am saying **do not take the side of corruption.**

If a field refuses transparent testing of a key artifact, defending its conclusions is bad science.

You say access can be restricted for conservation risk, political control, bureaucracy, or national sovereignty. That might be understandable if it were only the graffiti. But they restrict access to the so-called Giza underworld and the Great Labyrinth, and they bury areas under sand. If you do not see corruption there and just label it “frustrating,” then you are blind to what is happening.

Zeus

Nature must be dual: **black hole and white hole**. Otherwise, infinite regress remains unsolved.

White hole = generation of matter = Growing Earth = smaller Earth in the past = lower gravity = evolution permitted larger creatures = competition drove ever-greater size = secret societies reveal the truth in plain sight = visit the Zeus statue, and wait for it...

Yes, Zeus really was that tall!

White hole also = Hollow Earth = evolution began far earlier than expected = humanity is much older than believed = wait for it...

Yes, Zeus was *alive* at one point.

- Seated full composition: ~12–13 m
- Throne/structure contribution: ~4–5 m
- Remaining Zeus figure (if standing): ~7–8.5 m

If Zeus stood up, he'd likely still be **around the height of a 2–3 story building**, just not quite as tall as the full seated monument suggests.

In sum:

Nature cannot be a one-way street; it must be reciprocal. A universe that only consumes matter leads to infinite regress. Therefore nature must contain its opposite. The black hole recycles matter; the white hole generates it. A world that generates matter must grow. A growing Earth was once smaller. A smaller Earth possessed lower gravity. Lower gravity permitted larger forms of life. The giants remembered in myth may therefore be echoes of a forgotten world. If humanity is older than believed, then mythology may contain history disguised as symbol. The gods may not have been inventions; they may have been memories.

I am not saying Zeus was definitely real; I am saying his existence cannot be ruled out.

Would I bet money that Zeus might have been based on a real being—by “real,” I mean something like a walking, talking giant? Yes. Why else would secret societies preserve his memory? Perhaps the ancient heroes really were giants—the “men of renown.”

“There were giants in the earth in those days...” — Genesis 6:4 (KJV)

Bad Backs

See: *Humans are not from Earth: a scientific evaluation of the evidence*

Ellis Silver argued that human back problems and varicose veins are evidence that we evolved in a world with significantly weaker gravity. He also pointed out that humans get sunburned easily if exposed to the sun for too long. Therefore, he suggested that we came from a planet with much less sunlight, or a thinner, different kind of atmosphere. He noted that human babies have extremely large heads, making childbirth dangerously difficult and painful compared to other species on Earth. He also speculates that human genetic makeup may have been engineered.

I have to confess I haven't read Ellis Silver's book, so I might be misrepresenting him. But if this is what he broadly claims, then his arguments, or at least many of his 50 specific points, do not really point to another planet out there, but rather to the Earth itself when it was younger and smaller. In that sense, they point toward the idea of a **Hollow Earth**.

Modern science will say that our bad backs are explained by bipedalism, etc., but this does not resolve the deeper philosophical question, which is: is nature really that “stupid,” or is modern science missing something fundamental?

I think you don’t get excellent eyesight and chronic back problems at the same time without there being something else going on! That “something” could be a lower-gravity environment on a smaller Earth with less mass. This would also help explain the large size of dinosaurs.

And sunburn susceptibility, in this view, could be due to our ancestors originating from a Hollow Earth with a different environment. We were accustomed to a gentle plasma sun, so no wonder we got burned when we saw the surface sun for the first time.

Then there is childbirth. Modern science explains this through the “obstetric dilemma”: large brains evolved for cognition, while the pelvis evolved for bipedal walking, creating a trade-off within Earth evolution rather than a mismatch to another planet. However, this does not fully resolve the underlying issue that childbirth is unusually difficult and risky compared to other species on Earth.

In a Hollow Earth or smaller-Earth scenario, this trade-off could still exist but would be less extreme and therefore less dangerous. If Earth has grown over time, then what was once a manageable compromise may have become more stressful under higher gravity conditions.

Finally, his suggestion that human genetic makeup may have been engineered might not imply extraterrestrials, but rather an advanced human civilization living inside the Hollow Earth. In this view, they

could still exist there today and may occasionally appear in our skies in what we interpret as UFOs.

And who knows? Maybe these advanced humans really did mess with our genome. Maybe they altered human DNA in some way.

King Kong Theory

The following is taken from a Quora post I made a while back.

Introduction

What if everything you thought you knew about our planet was turned on its head? Imagine the Earth not as a perfect sphere, but as a giant cuboctahedron with hidden secrets and ancient mechanisms as old as time driving its growth. Gear up with your VR headset as we embark on a mind-bending journey that challenges the conventional wisdom of Pangea and opens the door to a revolutionary concept of our ever-expanding world. Join me in this thought-provoking exploration, where King Kong might have been our distant relative, our ancestors were giants, and now you know why your back hurts: the Earth has grown too big for our weak backs. Welcome to the intriguing theory of the Cuboctahedron-Earth.

Call this: The Giant Ape Theory. AKA: **King Kong Theory**

A New View

The Earth could be a giant cuboctahedron with 12 vectors, which some refer to as the 12 devil's graveyards around the world. There may be a way to determine if the Earth is indeed a cuboctahedron. If it is, it could reset entropy as I have described in my other work, using recycled matter to facilitate growth over time. If this is true, we could have a new source of energy—the mechanism that drives the Earth's growth. This is my idea in a nutshell. Consequently, I believe the theory of Pangea is false.

Ultimately, Pangea is either true or it is not. If it is not true, one possible explanation could be that the Earth is expanding.

I struggle to believe in Pangea because it seems absurd to me. The concept of Pangea essentially portrays Earth as an island floating in space. Imagine the universe filled with such islands—it's a silly notion!

However, if Pangea is a fact, how can it be disproved? Facts cannot be disproved. But Pangea is not a fact; it is a theory. Like all theories, it will eventually be replaced by a new one. Unfortunately, this might take some time. Look up the famous rabbit-duck illusion to understand why science and theories can sometimes be flawed.

The rabbit-duck illusion is a famous ambiguous image that can be perceived as either a rabbit or a duck, depending on the viewer's

interpretation. It was first published in 1892 in a German magazine called “*Fliegende Blätter*” and later popularized by psychologist Joseph Jastrow in 1899. The rabbit-duck illusion is often used to illustrate how different people can see the same data or evidence and come to different conclusions. In science, this underscores the importance of perspective and the idea that theories are subject to interpretation and change. Just as people can switch between seeing a rabbit and a duck, scientific theories can shift as new evidence and perspectives emerge.

The illusion serves as a metaphor for the nature of scientific theories: they are not absolute truths but rather interpretations that can change with new insights and evidence. Applying this to the Pangea theory suggests that: All the facts that support Pangea can also be interpreted to support the idea of a growing Earth. Therefore, the evidence for Pangea is not definitive and is open to interpretation. In essence, **Pangea has zero conclusive evidence supporting it**, as all the evidence can be alternatively explained by other theories such as the growing Earth hypothesis. This illustrates the fluid nature of scientific theories, which can change or be replaced as new interpretations and evidence emerge.

Framing the Argument

Definition of Evidence

1. **Exclusive Evidence:** Evidence that supports only one theory to the exclusion of all others.

2. **Non-Exclusive Evidence:** Evidence that can support multiple theories.

The Argument

If evidence is defined strictly as something that exclusively supports one theory, then:

1. **Premise:** Evidence (E) that supports both Theory 1 (Pangea) and Theory 2 (Growing Earth) is non-exclusive.

2. **Conclusion:** Therefore, (E) does not constitute evidence for either theory if evidence must be exclusive.

Application to Pangea

1. Geological Evidence:

o The fit of continental coastlines, fossil distribution, geological formations, and paleoclimatic data are traditionally used to support the Pangea theory.

o If all these pieces of evidence can also be explained by the Growing Earth hypothesis, they are non-exclusive.

2. Zero Exclusive Evidence:

o According to our definition, Pangea has zero exclusive evidence supporting it because the same evidence can support the Growing Earth theory.

o Thus, in this framework, Pangea has no unique evidence that solely confirms its validity.

Reframing the Argument

To summarize:

1. **Strict Evidence Definition:** Evidence must be exclusive to count as supporting a theory.

2. **Pangea's Evidence:** All evidence for Pangea is non-exclusive because it can also be interpreted to support the Growing Earth hypothesis.

3. **Conclusion:** Therefore, under our definition, Pangea has zero exclusive evidence supporting it.

Conclusion

In this logical framework, evidence that supports multiple theories does not count as true evidence for any one of those theories. Thus, by definition, Pangea lacks exclusive evidence.

In science, it's challenging to find evidence that supports only one theory to the absolute exclusion of all others because the natural world is complex, and many phenomena can be explained in multiple ways.

However, some evidence can be highly indicative of one theory over others, making it much more compelling for that theory. We can call this: **Exclusive Evidence**.

However, as far as I can see, Pangea has none of that.

1. Paleontological Evidence (Fossil Distribution):

- o Observation: Fossils of the same species found on continents separated by oceans.

- o Example: Mesosaurus fossils found in South America and Africa.

o Explanation with Growing Earth: According to the growing earth hypothesis, the continents were once connected, and as the earth expanded, they moved apart. Therefore, fossils of the same species could have originated when these landmasses were still contiguous. As the earth grew, the continents separated, carrying these fossils to their current locations.

2. Geological Evidence (Matching Rock Formations):

o Observation: Similar rock formations and geological structures align when continents are reconstructed.

o Example: Appalachian and Caledonian mountain ranges.

o Explanation with Growing Earth: As the earth expands, new crust forms at mid-ocean ridges. This process could explain the distribution of similar geological features across continents. The alignment observed today could reflect past configurations before expansion.

3. Paleoclimatic Evidence:

o Observation: Evidence of glaciation in now-warm regions.

o Example: Glacial deposits in Africa, India, and South America.

o Explanation with Growing Earth: A growing earth could affect global climate by changing ocean currents, atmospheric circulation, and the distribution of landmasses. Glacial evidence in unusual locations could be interpreted as a result of earth expansion altering global climate patterns over geological time.

4. Fit of Continental Shelves:

- o Observation: The coastlines of continents fit together like puzzle pieces.

- o Example: The match between South America and Africa.

- o Explanation with Growing Earth: Continental drift theory suggests these fits are remnants of a larger landmass (Pangea) breaking apart. In a growing earth scenario, these fits might indicate previous configurations before expansion, similar to how pieces of a puzzle shift as they expand.

5. **Paleomagnetic Evidence:**

- o Observation: Symmetrical magnetic stripes on either side of mid-ocean ridges.

- o Example: Patterns of magnetic anomalies.

- o Explanation with Growing Earth: Magnetic stripes are explained in plate tectonics by sea floor spreading. In a growing earth theory, these stripes might indicate changes in the earth's magnetic field due to expansion, influencing the formation of new oceanic crust.

Truly Exclusive Evidence?

- **Geological Structures:** Highly specific matches of geological structures across continents, like fossilized trees in aligned strata, could potentially challenge the growing earth hypothesis. Such precise alignments suggest a more static continental arrangement over long periods.

o Proponents of the growing earth hypothesis might, for example, argue that the Earth's expansion wasn't uniform but varied regionally, allowing certain areas to remain relatively stable in their positions for longer periods. This would mean that while the Earth as a whole was expanding, some regions could have maintained more stable geological relationships. Similarly, evolution might work in a way that involves sudden leaps rather than a gradual, continuous progression.

• **Genetic Evidence:** Genetic similarities among isolated species could support continental connections in the past (e.g., marsupials in Australia and South America). While genetic evidence alone isn't exclusive to plate tectonics, it strongly supports the idea of past land connections that are consistent with other geological evidence.

o Proponents of the growing earth hypothesis might explain genetic similarities among isolated species by suggesting that these similarities reflect ancient land connections that existed before significant expansion. They might argue that temporary land bridges, regional expansion, or pre-expansion distributions allowed species to migrate and interbreed, leading to shared genetic traits that were preserved even as the Earth expanded and the continents separated. They might also explore hypothetical mechanisms for species movement or consider evolutionary convergence as a potential factor.

Conclusion by Mainstream

In practice, evidence supporting the Pangea theory is rarely "exclusive" in the strictest sense because scientific evidence typically has

multiple interpretations. The strength of Pangea's support comes from the coherence and convergence of multiple lines of evidence rather than from exclusive evidence. The theory's robustness comes from how well it integrates various types of evidence into a unified model, making it the most compelling explanation given the available data.

My thoughts: The theory's robustness comes from how well it integrates various types of evidence into a unified model? As if the growing earth model doesn't do that! The only reason Pangea is favored is that the majority of scientists prefer it for some reason. Pangea isn't better than the growing earth model in any logical sense. At the end of the day, science is subjective, influenced by prevailing opinions. This subjectivity can be seen in the rabbit-duck illusion: if the dots comprising the picture are facts, then those facts alone cannot tell you whether it is a rabbit or a duck. Facts alone cannot define what reality is. Thus, science must be subjective—and highly subjective—at the end of the day. Ultimately, a scientist has to make a subjective call about what reality is, whether it's a rabbit or a duck. They always seem to go for the "duck"! Typical scientists. They're so down-to-earth that they need a ladder from philosophers. I hope this paper will serve as a ladder.

If it looks like a duck, swims like a duck, and quacks like a duck...

You might be dealing with a very professional rabbit!

Let me put this as clearly as I can: Pangaea is so stupid and ridiculous that I honestly can't believe anyone takes it seriously. Have you ever stopped to think about what it would actually

imply? A whole universe filled with floating islands? I mean, come on! It's so absurd that I genuinely don't understand how anyone can take it seriously.

The only way Pangaea could be real is if we're living in a simulation and that simulation was programmed by actual clowns. Other than that, there's not a snowball's chance in hell that Pangaea is true.

Skeptic: No! The evidence that Pangaea existed is extremely strong!

Reply: Yes, it is—and I agree! But that isn't the real fight! The real question isn't "*Is there evidence?*" It's "*Does that evidence uniquely imply Pangaea, or are geologists interpreting it through a stupid framework?*" I think they are.

So answer me this philosophical question: Can you imagine a universe filled with floating islands that actually makes sense? Does that picture of reality make sense to you? Or is Earth somehow special—the one place in the entire universe where giant islands occasionally break apart, drift around, and later rearrange themselves?

Skeptic: Yes—if by "islands like Pangaea" you mean worlds whose surface landmasses repeatedly assemble into supercontinents and later break apart, I can imagine a universe containing many such worlds. I don't see a logical contradiction in that picture.

Reply: ??? No, but then you're a moron in my book.

Skeptic: Fair enough!

Reply: Agree to disagree. Pangaea is beyond absurd!

Skeptic: Deal. Agree to disagree. Your verdict is officially: **Pangaea = nonsense**. Mine remains: weird-looking when viewed one way, but well-supported by geological evidence.

Reply: Oh, so you agree that it's weird-looking??

Skeptic: Yes—in the ordinary, intuitive sense, **absolutely**.

Reply: Well, there you go! Blinded by science, but not entirely immune to reason. There is hope yet. (And yes, the skeptic here was ChatGPT.) Thank you!

Skeptic: You're welcome! And I think we finally found the exact border of our disagreement: **"Pangaea sounds completely bonkers" doesn't necessarily mean "Pangaea didn't happen."**

Reply: I think it's too bonkers to be real. But the future will have to figure that out for itself.

Skeptic: Ok, so if you don't believe in floating islands? What do you believe in?

Reply: Giants.

Skeptic: Giants?! Seriously? Pangaea is nonsense, but giants aren't?!

Reply: Yeah, pretty much. Life comes in all kinds of sizes, so giants honestly don't strike me as anywhere near as crazy as giant islands drifting around. I think we've just been conditioned from childhood to accept whatever framework modern science gives us, so when something outside that framework comes along—even something that might actually make sense—we laugh at it automatically.

But hey, I get it. I can SEE how it sounds. I can laugh at it too. I probably wouldn't be laughing if a giant were standing there staring me in the face, though.

A Case for Giants

Conceptual Foundation: At the heart of the Earth, the core spins at such an extreme speed that it exists in a state of timelessness.

- The core of the Earth spins at an extremely high speed.
- Due to its extreme speed, the core exists in a state of timelessness.
- In a state of timelessness, entropy cannot exist because entropy relies on the progression of time.
- Since the core is timeless, it must continuously reset entropy.
- Resetting entropy at the core allows for the creation of new matter, as the typical decay and dissipation associated with entropy are circumvented.
- The core's ability to reset entropy leads to the generation of new matter within the Earth.
- The continuous generation of new matter at the core exerts pressure outward.
- This outward pressure causes the Earth to expand over time.

Thus, the argument is as follows: The extreme speed of the Earth's core results in a state of timelessness, which in turn resets entropy. This resetting of entropy facilitates the continuous creation of new matter at the core, leading to the Earth's gradual expansion.

Growing Earth and Hollow Earth

Expansion vs. Contraction:

- While gravity tends to contract the Earth, the continuous creation of matter within the Earth counteracts this force, leading to an overall expansion.
- As matter is generated from the core, it pushes outward, resulting in a growing Earth.

Cavities Formation:

- The continuous creation of matter causes internal pressures that lead to the formation of cavities within the Earth.
- These cavities contribute to a hollow structure where the Earth has numerous empty spaces, leading to a relatively lighter and more expansive planet.
- The creation of cavities can also cause geological features such as caves and underground tunnels.

Life Inside the Earth Initial Conditions:

- The stable, geothermal energy-rich environment inside the Earth provides ideal conditions for the emergence of life.
- Shielded from external cosmic radiation and meteor impacts, life could thrive and evolve in this protected environment.
- This protection means that life may have started much sooner than on the surface, potentially allowing evolutionary timelines to be much older.

Advanced Evolutionary Timelines:

- Due to the stable and protected environment, life inside the Earth could evolve faster and more efficiently than on the surface.
- This accelerated evolution means that complex life forms, including early humans, could have evolved much sooner than traditionally believed.

Gigantism in Low Gravity:

- A smaller, less massive Earth would have lower gravity.
- Lower gravity would reduce the physical constraints on size, allowing organisms to grow to gigantic proportions.
- Dinosaurs and giant apes could evolve in these conditions, benefiting from the abundant resources and stable environment.

Evolution of Giants

From Giant Apes to Giant Humans:

- Within the hollow Earth, primordial primates could evolve into giant apes due to the favorable conditions of low gravity and abundant resources.
- These giant apes, occupying different ecological niches, would avoid competition with other species and continue to grow and evolve.

Evolutionary Advantages of Gigantism:

- Gigantism offers several evolutionary advantages, including increased strength, dominance in social hierarchies, and enhanced survival capabilities.

- Over time, some of these giant apes could evolve into giant humans, developing advanced social structures, cultures, and technologies.

Migration to the Surface:

- As the Earth continues to grow and its gravity increases, environmental changes inside the Earth could drive some species to migrate towards the surface.

- Proto-humans, descendants of giant apes, would adapt to the new surface conditions, evolving into anatomically modern humans.

- This process challenges the conventional “Out of Africa” theory, proposing an alternative origin from within the Earth.

Explaining the Size of Dinosaurs Giant Size of Dinosaurs:

- The lower gravity of a smaller, growing Earth would have allowed dinosaurs to evolve to enormous sizes.

- As the Earth grew and gravity increased, these giant species would face new environmental pressures (e.g., a stronger gravity), possibly leading to their extinction.

- The fossil record of large dinosaurs can be reinterpreted through this lens, suggesting that their size was a result of the lower gravity environment of the early Earth.

Conclusion

The growing Earth hypothesis, grounded in the concept of a timeless core continuously creating matter, provides a compelling framework to explain the hollow structure of the Earth, the evolution of gigantic life forms, and the origins of modern humans. By proposing that life began inside a hollow Earth with lower gravity, it offers an alternative explanation for the gigantism observed in ancient creatures. This perspective suggests that life inside the Earth could have evolved much sooner due to the protected environment, leading to advanced evolutionary timelines and potentially earlier human evolution. This model challenges conventional scientific paradigms, inviting a reconsideration of the Earth's geological and biological history.

Hollow Earth

The following is from ChatGPT:

The Hollow Earth theory posits that the Earth is either entirely hollow or contains substantial interior spaces. This idea has historical roots and has been the subject of various myths and legends. Here is a general basis for the Hollow Earth theory and why some scientists have considered it:

Historical and Mythological Roots

- **Ancient Myths and Legends:** Many cultures have stories of an underground realm inhabited by mystical beings. For instance, in Greek mythology, Hades is the god of the underworld. Native American folklore often speaks of underground civilizations.

- **Early Scientific Theories:** In the 17th century, Edmond Halley, the astronomer after whom Halley's Comet is named, proposed that the Earth consists of a hollow shell about 800 km thick, with two inner concentric shells and an innermost core. Halley speculated that each shell had its own magnetic poles and atmospheres.

Key Elements of the Hollow Earth Theory

- **Subterranean Civilizations:** Proponents suggest that advanced civilizations live within the Earth, possibly with their own ecosystems and sources of light, such as the hypothetical inner sun.

- **Geological Features:** Some theorists interpret certain geological formations and seismic activities as evidence of large hollow spaces within the Earth.

- **Expeditions and Reports:** Throughout history, there have been reports and supposed expeditions to the poles, where explorers claimed to have found entrances to the inner Earth. Admiral Richard E. Byrd's expeditions in the early 20th century are often cited by Hollow Earth proponents, though mainstream historians and scientists dispute these claims.

Scientific Considerations

- **Seismic Evidence:** Modern geophysics relies heavily on seismic data to understand the Earth's interior. The propagation of seismic waves (P-waves and S-waves) provides detailed information about the

Earth's layers, indicating a solid and differentiated structure (crust, mantle, outer core, inner core) rather than a hollow one.

- **Gravity and Mass Distribution:** The Earth's gravitational field is consistent with a solid body. A hollow Earth would have different gravitational properties, which would be detectable through satellite measurements and surface gravity observations.

- **Magnetic Field:** The Earth's magnetic field is generated by the movement of molten iron in the outer core. A hollow Earth model does not adequately explain the geomagnetic field's observed properties.

Why Some Contemporary Scientists Still Believe in It

- **Alternative Interpretations of Data:** Some proponents argue that unexplained anomalies in seismic data could indicate the presence of vast hollow spaces or different structures within the Earth. They interpret these anomalies as evidence supporting the Hollow Earth theory.

- **Geological Phenomena:** Certain unexplained geological phenomena, such as sudden sinkholes, large cavernous structures, and unexplored deep cave systems, may lead some to speculate about larger hollow spaces within the Earth.

- **Conspiracy Theories and Mistrust of Mainstream Science:** A significant number of people who believe in the Hollow Earth theory subscribe to broader conspiracy theories. They may distrust mainstream scientific institutions and believe that information about the true nature of the Earth is being suppressed.

- **Historical Precedents:** They may cite historical examples where mainstream science was initially resistant to new ideas, such as the acceptance of heliocentrism or the theory of continental drift, as a reason to remain open to alternative theories.

- **Spiritual and Mystical Beliefs:** Some individuals incorporate the Hollow Earth theory into broader spiritual or mystical belief systems. They may believe in the existence of subterranean civilizations or advanced beings living within the Earth, which aligns with their philosophical or metaphysical views.

- **Personal Experiences and Anecdotal Evidence:** There are reports and anecdotes from explorers, researchers, and even military personnel that describe encounters or evidence of hollow regions within the Earth. Believers often consider these personal accounts as compelling evidence.

- **Appeal of Alternative Science:** The idea of a Hollow Earth can be incredibly appealing from a narrative and imaginative standpoint. It offers a sense of mystery and the potential for discovery that resonates with the human spirit of exploration.

- **Critique of Current Paradigms:** Some scientists may entertain the Hollow Earth theory as a critique of current scientific paradigms, emphasizing the importance of questioning established knowledge and remaining open to unconventional ideas.

Conclusion

While the Hollow Earth theory has historical and mythological significance and continues to intrigue some people, the overwhelming consensus in the scientific community is that the Earth is not hollow. This conclusion is based on extensive seismic data, gravitational studies, and our understanding of planetary formation and dynamics.

My Take

I used to be a proud new atheist, idolizing the four horsemen of the apocalypse: Christopher Hitchens, Richard Dawkins, Sam Harris, and Daniel Dennett. In many respects, they are still my heroes, even though I now disagree with many of their ideas. For example, I don't believe in the selfish gene; I think Denis Noble is right about that.

Then I came across the theory of Pangea, and my respect for science plummeted. I couldn't fathom how grown, respectable men believed in such nonsense, and that it was considered actual science in modern times. My enchantment with the scientific community shattered, and I became thoroughly disillusioned.

So, when the overwhelming consensus in the scientific community asserts that the Earth is not hollow, I think, so what? What do these so-called experts really know? We are a Type 0 civilization; why should I listen to them? Instead, I trust my own logical brain, which tells me the Great Pyramid was made by the Atlanteans. For a race of Atlanteans to fit into the evolutionary timeline, humans must have evolved much sooner, meaning life could not have started in the oceans. It must have started earlier, requiring protection from a hostile primordial Earth environment.

The early Earth was extremely hostile. It had intense volcanic activity, a thick, toxic atmosphere, frequent meteorite impacts, high temperatures, and intense radiation. These conditions suggest life could

have originated inside the planet, protected from these harsh surface conditions.

In other words, unexplained anomalies in seismic data could indeed indicate the presence of vast hollow spaces!

If I am wrong and you favor contemporary science, then do me a huge favor: actually do the science. Test the Khufu graffiti inside the pyramid. This has not been done. Test it, and then we will see if it is a tomb for a Pharaoh or made by Atlanteans, as Master Mason Manly Palmer Hall suggests.

In other words, if you think you are right, if you are so sure, then please test the graffiti. What are you waiting for? If you test the graffiti, you will see that Atlantis existed, which means we must alter the evolutionary timelines, indicating that life must have originated inside the Earth.

And it rings true, doesn't it? All life starts inside, not outside like contemporary science believes.

All life begins in the womb.

The UFO

The following is from ChatGPT:

Bernardo Kastrup's extensive essay "*UAPs and Non-Human Intelligence: What is the most reasonable scenario?*" discusses various hypotheses regarding the origin of UAPs (Unidentified Aerial Phenomena). Here are some of the key points from the essay: (99+) *UAPs and Non-Human Intelligence: What is the most reasonable scenario?* | Bernardo Kastrup - Academia.edu

1. Recent Developments and Credibility: Since 2017, there have been significant disclosures about UAPs, including testimonies from credible sources like Commander David Fravor and intelligence officer David Grusch, which have added weight to the phenomenon and made it worthy of serious consideration.

2. Two Key Characteristics:

- o **Physical and Psychological Effects:** Based on the work of Dr. Jacques Vallée, Kastrup highlights that UAP phenomena often blur the lines between physical and psychological effects. This dual nature complicates straightforward explanations.

- o **Behavior Not Consistent with Extraterrestrial Hypothesis:** The frequency and nature of UAP sightings suggest that they may not be extraterrestrial visitors but rather phenomena originating from Earth itself.

3. Two Distinct Phenomena:

- o **Nuts-and-Bolts UAPs:** These are physical crafts consistently observed near military installations, especially nuclear sites. They be-

have like technological devices and have been reportedly stored and analyzed.

- o **High Strangeness Events:** These involve more elusive and dreamlike encounters, often personal and symbolic, not consistently leaving physical traces.

4. **Ultra-Terrestrial Hypothesis:** Kastrup entertains the idea that these UAPs could be remnants of an ancient terrestrial civilization that predates humanity by millions of years. This civilization could have retreated underground or underwater to avoid surface-level cataclysms.

5. **Mind-Manipulation and Communication:** He suggests that the UAPs might be attempting to communicate with humans through symbolic and metaphorical means, directly manipulating human perception and cognition, similar to how deeper layers of the human mind communicate through dreams.

6. **Testing the Hypothesis:**

- o **Biochemical Analysis:** If the biological samples from UAPs (as claimed by some sources) share terrestrial biochemistry, it would support the idea that they are of Earthly origin.

- o **Isotope Ratios:** Analyzing the materials of UAP crafts for isotope ratios consistent with Earth's environment could further support the hypothesis.

Conclusion

While Kastrup does not explicitly state that these ancient civilizations were lizard people, his use of the "Silurian Hypothesis" certainly

allows for the interpretation that these could have been non-human, possibly reptilian intelligences. This aligns with the broader speculative nature of his argument and the hypothesis itself, which considers how difficult it would be to detect such ancient civilizations today due to geological processes.

Reply:

Back then, who else could have logically evolved besides lizard people?

ChatGPT:

Given the context of the Silurian Hypothesis and the geological timeframes involved, it is reasonable to speculate about what kinds of intelligent life forms could have evolved millions of years ago on Earth. Here are a few possibilities, with a focus on the types of organisms that existed during those periods:

1. Reptilian Life Forms:

o **Reptiles and Dinosaurs:** During the Mesozoic Era (which came after the Silurian period), reptiles, including dinosaurs, were the dominant terrestrial vertebrates. It is conceivable that an advanced form of reptilian life could have evolved intelligence. The idea of “lizard people” or advanced reptilian civilizations ties into this speculation. Given the long dominance of reptiles, it is plausible within this speculative framework to consider that some could have developed advanced civilizations before being wiped out by catastrophic events.

2. Aquatic Life Forms:

o **Cephalopods:** Cephalopods like octopuses and squids are known for their intelligence among invertebrates. If an intelligent civilization arose from the oceans, it might be based on creatures similar to ancient cephalopods. Given the vast time scales, it's possible to imagine that some aquatic life forms could have developed sophisticated technology and culture.

o **Marine Reptiles:** During the Mesozoic Era, marine reptiles like plesiosaurs and ichthyosaurs dominated the oceans. An intelligent marine civilization could have evolved from such ancestors.

3. **Arthropods:**

o **Ancient Arthropods:** Arthropods, including insects, arachnids, and crustaceans, have existed for hundreds of millions of years. In a speculative scenario, it's possible to consider that some form of ancient, highly intelligent arthropod could have developed complex societies.

4. **Therapsids:**

o **Therapsids (Mammal-like Reptiles):** Before the rise of true mammals, therapsids were dominant terrestrial vertebrates during the Permian and early Triassic periods. These creatures are a bridge between reptiles and mammals, and it's conceivable that a branch of therapsids could have developed advanced intelligence and technology.

5. **Avian Dinosaurs:**

o **Bird-like Dinosaurs:** Some avian dinosaurs, which are the ancestors of modern birds, showed complex behaviors. It's speculative but possible to imagine that some advanced form of avian dinosaur might have evolved intelligence.

Supporting Evidence for Speculation

• **Geological Erasure:** The idea that evidence of such civilizations would be difficult to detect is supported by the concept of geological recycling, where the Earth's crust is continually reformed through processes like plate tectonics, erosion, and sedimentation. This makes the survival of physical evidence over hundreds of millions of years unlikely.

• **Evolutionary Timeframes:** The timeframes discussed allow for multiple possibilities of intelligent life arising and being wiped out by natural disasters or other catastrophic events, aligning with theories proposed in the Silurian Hypothesis.

While the Silurian Hypothesis and Kastrup's interpretations are highly speculative and not based on direct evidence of ancient advanced civilizations, they open the door to considering a wide range of possible non-human intelligences that could have existed on Earth long before humans. These speculations draw from known evolutionary and geological processes to propose intriguing possibilities about the distant past.

Reply:

Why does Bernardo dismiss Atlanteans?

ChatGPT:

In Bernardo Kastrup's essay "UAPs and Non-Human Intelligence: What is the most reasonable scenario?", he addresses and ultimately dismisses the hypothesis of pre-Diluvial high-tech human civilizations, such as the mythical Atlanteans, for several reasons:

1. Lack of Physical Evidence:

o Kastrup argues that any advanced civilization would have left behind significant and long-lasting footprints on the terrain and environment, such as mining holes, landfills, urban infrastructure, and artificial pollutants like microplastics. Despite being degraded over time, these traces would still be conspicuous enough if they existed only several thousand years ago, yet no such evidence predating our own civilization has been found.

2. Industrial Footprints:

o The development of high technology requires extensive industrial infrastructure. This includes phases of urbanization, metal mining, burning of hydrocarbons, construction of vast industrial parks, and logistical transport infrastructure. Such industrial activities would leave unmistakable geological and environmental signatures, which we do not observe in the period suggested for Atlantis or similar myths.

3. Geological Timeframe:

o Kastrup emphasizes that for a civilization to leave no traces due to geological processes like erosion and plate tectonics, it must be ancient enough for these processes to have erased all evidence. This would place it far beyond the timeline commonly associated with myths like

Atlantis, which are typically situated only a few thousand years ago, rather than the hundreds of millions of years suggested by the Silurian Hypothesis.

4. The Silurian Hypothesis:

o The Silurian Hypothesis, which Kastrup references, posits that an industrial civilization could have existed on Earth up to 350 million years ago. This hypothesis fits within the broader context of life evolving in different epochs and potentially being erased by natural geological processes. This hypothesis does not align with the more recent timelines proposed for civilizations like Atlantis.

In summary, Kastrup dismisses the idea of Atlanteans or similar pre-Diluvial high-tech human civilizations because of the lack of substantial and specific evidence that such civilizations would have inevitably left behind. Instead, he considers much older, non-human possibilities that would fit within the vast geological timescales necessary for their traces to have been erased by Earth's natural processes.

My Take

Bernardo Kastrup makes several logical errors here. First, he assumes that the Atlanteans themselves are not survivors of a prior world-ending event, which legend says they were. Thus, the Atlanteans could have been gods living among primitive people; their infrastructure to create new technology might have been lost, but they retained some technology. When the Great Flood occurred, as Randall

Carlson discusses, there would have been no evidence left except for the great works from the past, like the Great Pyramid, Angkor Wat, etc., which contemporary archaeologists believe were made by our primitive ancestors!

Another assumption Kastrup makes is that contemporary science is correct in stating that life started in the oceans. However, if life started inside the planet, human civilizations could have evolved to a point where what we call UFOs are feasible. At some point in history, some humans, voluntarily or not, might have reached the surface world, carried some technology with them, and founded civilizations such as Atlantis. It was probably not called Atlantis, though.

The last assumption Kastrup makes is that the development of high technology requires extensive industrial infrastructure. However, Atlantean technology was based on the Philosopher's Stone, which doesn't require sophisticated technology to create. There is a book online now that tells you how to make one: *The Book of Aquarius* by Anonymous.

You might argue that UFOs require extensive industrial infrastructure, which is correct. However, this infrastructure might be found inside the planet, which is why we haven't found evidence of it.

Additionally, Kastrup mentions that UAPs seem particularly interested in human activities that could jeopardize the planet's habitability, such as those involving nuclear technology and military exercises.

This suggests that these intelligences might be monitoring activities that could lead to large-scale destruction. But why would lizard people do that? Call me biased, but why would lizard people care about our nukes when Kastrup argued space aliens wouldn't care? Kastrup argues that extraterrestrial beings might not have the same level of concern for Earth-specific issues like nuclear technology. From their perspective, events on Earth might not pose a direct threat to them or their interests if they are not based here. But why would the lizard people care when they are not our kin, despite being based here? They live safely underground. However, if these UFOs are piloted by humans, Inner-Earthers/Atlanteans, then we can see why they care: they are our kin.

Imagine an Atlantean gazing at our science and saying:

"Oh, so you think life started outside the mother's womb? And you believe Earth was once a giant floating island? Cute. And let me get this straight—you think the pyramids were tombs? Really? And nukes? Seriously?! That's your idea of a good time? And don't even get me started on String Theory, you morons! There's a reason we hide from you: it's not just to avoid the floods, it's to avoid the embarrassment of being related to you!"

You might wonder: Could the Atlanteans have been in contact with our government all this time? Could they have been gradually providing us with technology? Let me ask Chat: Do computer chips have mysterious or obscure origins in reality?

ChatGPT:

In reality, the origins of computer chips (integrated circuits) are generally well-documented, though there are aspects that could be

considered mysterious or obscured due to their complex history and the nature of classified military research. Here's a look at the real history and any associated mysteries:

Origins and Development:

1. Early Developments:

- o **Transistors:** The invention of the transistor in 1947 by John Bardeen, Walter Brattain, and William Shockley at Bell Labs was a breakthrough that set the stage for modern electronics. This technology was publicly announced and has clear historical documentation.

- o **Integrated Circuits (ICs):** Jack Kilby of Texas Instruments and Robert Noyce of Fairchild Semiconductor independently developed the integrated circuit in the late 1950s.

Both of their contributions are well-documented and celebrated in the history of technology.

2. Military Influence:

- o **Funding and Applications:** The early development of electronics, including ICs, was influenced by military needs for advanced technology, particularly during and after World War II. While the specific details of some military projects might have been classified, the foundational technology behind computer chips is publicly known.

- o **Cold War Era:** During the Cold War, the U.S. and other countries invested heavily in research for advanced electronics, including computer chips, to support defense technologies. While some research was classified, it was eventually integrated into civilian applications.

3. Classified Research:

o **Research and Secrecy:** Some early research related to computer chips and associated technologies was classified due to national security concerns. For example, the development of early computers and advanced electronics for military purposes was often secretive. However, these technologies eventually transitioned to civilian use and were publicly documented.

4. Commercialization and Public Knowledge:

o **Transition to Civilian Use:** Technologies developed under military contracts or research often found civilian applications over time. Once declassified or commercially viable, these technologies became widely available and their origins were publicly disclosed.

o **Historical Records:** The history of computer chips is well-documented through patents, scientific publications, and industry records. While specific military applications might have remained classified, the general development and commercialization of ICs are well-understood.

Potential Areas of Mystery or Obscurity:

1. **Early Prototypes:** Details about early prototypes and experiments might be less well-known, particularly those developed in classified settings. Early work on chips for specific military applications could have involved technologies not fully disclosed at the time.

2. **Innovations in Secrecy:** Some innovations in semiconductor technology may have been developed under classified programs, with

the details of the research and development process kept secret. This could create a sense of mystery around specific advancements.

3. Lost Documentation: As with many historical technologies, some records and documentation may be lost or incomplete, creating gaps in the historical narrative.

Summary:

While the fundamental development of computer chips is well-documented, there are elements of their history that involve classified military research and early prototypes that might not be fully transparent.

However, these aspects do not constitute a profound mystery akin to lost civilizations but rather reflect the typical complexities and secrecy associated with advanced technologies in their early stages.

My Take

Details about early prototypes and experiments might be less well-known, leaving room for the possibility of Atlantean involvement. That is indeed fascinating.

What is the end game, though? Why would Atlanteans give birth to digital superintelligence? I'll leave that for you to ponder.

Let's move on: If Master Mason Manly Palmer Hall is correct and the Atlanteans restarted civilization after the Great Flood, then we can understand where the Maya might have derived their ideas about

a hollow Earth. If the Atlanteans or their ancestors emerged from underground, it becomes clearer why these myths have been preserved among the natives.

For example:

1. **Hopi Legends:** The Hopi people have stories of their ancestors emerging from underground worlds. They believe in a series of worlds, and their creation myth speaks of their emergence from underground after each previous world was destroyed.

2. **Navajo Beliefs:** The Navajo creation story includes an emergence from an underground realm. They describe multiple worlds beneath the Earth's surface that the people ascended through before reaching the current world.

3. **Maya and Aztec Myths:** In Mesoamerican cultures, such as the Maya and Aztecs, there are also stories of underground realms, often associated with the afterlife or places of origin.

Traditional Beliefs

1. Hopi Mythology:

o The Sipapu is considered a physical location in the Grand Canyon, believed to be the place of emergence from the previous world to this one. For the Hopi, this is not merely a metaphor but a real, sacred site with deep spiritual significance.

2. Navajo Mythology:

o The Navajo emergence stories also refer to real places that are considered sacred. These places are seen as points of connection be-

tween the different worlds and this world. The physical landscapes hold cultural and spiritual importance.

3. **Maya Mythology:**

o The entrances to Xibalba, such as caves and cenotes, are real physical locations that the Maya believed to be gateways to the underworld. These sites were often used for rituals and are significant in archaeological studies.

Some final words:

The Grand Canyon is evidence of the Great Flood in the Bible, according to Randall Carlson. Atlanteans lived among the Maya, which is why they know about the hollow Earth. There is a way to find out all of this: test the graffiti. It is the only thing standing between our world and King Kong!

Leviathan = smaller Earth = sea monsters were real!

Loch Ness Monster (Nessie) = a creature coming up from the Hollow Earth?

My model would still have to reproduce the measured P-wave and S-wave travel times, refraction patterns, shadow zones, and normal modes of the Earth. Simply saying, “The waves are being interpreted incorrectly,” would not be enough.

But this reminds me of Wittgenstein, who supposedly said: “*Well, what would it have looked like if it had looked as though the Earth was rotating?*” Likewise, if the Earth really does create its own mass, and that mass causes the Earth to grow, then the Earth might appear solid precisely because mass is constantly being transported through it. That doesn’t mean a hollow Earth is impossible; the hollow region could simply be hidden within dynamics that our instruments don’t directly pick up.

Logically, could you have a kind of hollow Earth that our instruments don’t detect if the Earth is dynamic rather than static? Logically, yes.

And saying, “The Earth’s gravitational field is consistent with a solid body,” gives us one possible picture. But it could also be consistent with a dynamic model if that model can reproduce the same gravitational measurements.

Then there’s this objection: “The Earth’s magnetic field is generated by the movement of molten iron in the outer core. A hollow Earth model does not adequately explain the geomagnetic field’s observed properties.”

Yes, it potentially can—if, in my model, the magnetic field is generated by the hypothetical plasma sun inside the Earth.

In sum: A dynamic model could potentially change what constraints apply.

A sufficiently different dynamic model could, in principle, change the inference from the measurements. Standard seismic conclusions are obtained using physical assumptions about how density, elasticity, pressure, temperature, composition, and phase vary throughout the Earth. If we propose fundamentally different interior dynamics, we'd have to calculate the observations under those dynamics before knowing what they permit.

So there is a logical door open here. And saying "gravity would crush a hollow Earth" doesn't logically follow if the Earth is dynamic and produces its own mass and water. Gravity would crush a static Earth—that is, a static hollow Earth—sure, but that's not what I'm talking about!

And how hollow is the Hollow Earth? **I don't know.** But it would have to support the evolution of life and at least one human city down there. So saying our instruments point to a solid Earth isn't evidence that the entire thing is butt-solid! There could still be huge spaces down there.

And my model (DEMU) is **more conceptually unified**: I'm trying to have a single circulation/recycling mechanism explain mass transport, internal energy, gravity, and magnetism, rather than assigning each of them a largely separate mechanism!

Origins of Man

- Coming from the Spirit World
- Coming from the Titans (Helena Blavatsky)
- Evolved from normal apes
- Evolved from giant apes in the Hollow Earth
- Co-evolved with mushrooms (Stoned Ape Theory)
- Plants (Mother Ayahuasca) wanting to leave Earth but needing hands; therefore, they/she made man
- Simulated by some supercomputer
- Seeded by humans from another planet
- Seeded by humans from another galaxy
- Seeded by humans from another universe
- Seeded by humans from a previous universe!
- Created by aliens

- Modified by an inner Earth civilization
- Other

Note: The “Stoned Ape Theory” is a bold and mind-expanding idea popularized by ethnobotanist Terence McKenna. It suggests that early hominids may have kick-started human consciousness and brain expansion through the use of psilocybin-containing mushrooms.

Note: Plants (Mother Ayahuasca) wanting to leave Earth: I think the story goes like this—Gaia (Earth’s consciousness) realizes that the Sun is slowly dying and will eventually destroy Earth. In response, she seeks to expand into space. But lacking the hands needed to build rockets or technology to leave, she must find an alternative solution: the creation of man.

My bet:

I believe idealism is true; thus, I lean toward this: *Coming from the Titans (Helena Blavatsky)*. I think Blavatsky may have had access to **real knowledge** hidden in the world. The Titans, in turn, may point to something even deeper: *coming from the Spirit World*.

Or: *evolved from giant apes in the Hollow Earth*. And perhaps also: *co-evolved with mushrooms (Stoned Ape Theory)*.

And: *modified by an inner Earth civilization*.

But I wouldn't be surprised if: *plants (Mother Ayahuasca) wanting to leave Earth but needing hands; therefore, they/she made man.*

I do not believe: *evolved from normal apes*. Why? Because that would imply that Pangaea is true, and I don't believe in Pangaea.

Ra and the Cosmic Egg

If an inner Earth civilization knew that the universe arose from the cuboctahedron, and also knew that all is mental, then Ra (*cosmic mind*) and the Egg (*cuboctahedron*) makes symbolic sense. The shape of the cuboctahedron could resemble an egg. I mean, how do you explain the cuboctahedron to hunter-gatherers? You say the universe arose from an egg, and then later you encode the real geometry symbolically.

Seeded by humans from a previous universe: Imagine they discovered that humanity—or humanity's blueprint—was already present at the beginning of time, because our ancestors came from a previous universe and developed the technology to create new universes, seeding the human code into this one from the very beginning. Ra emerging from the egg, indeed.

So, imagine that everything is mental. Imagine evolution has produced a cosmic mind so vast that it can create humans directly. Now the Titans are born. But the physical world at this stage is more spiritual and mental than physical. Over time, the Earth grows and becomes increasingly physical. The Titans shrink in size, giving way to the gods, like Zeus. The Earth grows even more, and eventually you reach man and what appears to be a physical world that has always been physical—but actually started out as something more dreamlike, because idealism, not materialism, is true.

But we share genes with apes? Yes—but in this hypothesis, whatever power created life on Earth created everything as part of one shared environment. Genetic similarity wouldn't necessarily mean that we evolved from apes, any more than two cars from the same manufacturer being almost identical under the hood means that one car evolved from the other.

Skeptic: A designer could theoretically reuse genetic material, just as an engineer reuses components. But evolutionary common ancestry isn't inferred merely because humans and other apes have similar genes. The evidence includes the patterns of similarities and differences—shared mutations, pseudogenes, endogenous retroviral insertions, chromosome structure, nested genetic relationships, and fossils. Common ancestry provides a powerful, unified explanation for those patterns.

Also, scientifically speaking, humans **are apes**. The standard claim isn't really that "humans evolved from the apes you see today." Humans and chimpanzees, for example, are understood to descend from a common ancestral population.

Reply: Yeah, I know all that, and I agree. But suppose you're an incredibly powerful creator. What would the difference be if you set life in motion while incorporating a biological blueprint inherited from a previous universe or an earlier evolutionary process, and then let the two unfold side by side?

You could even imagine two human lineages: one descended from the Titans, and another that evolved naturally from giant apes in the Hollow Earth through convergent evolution.

Okay, I'm just speculating here. I don't know how humans got here. I'm just trying to keep an open mind.

But wouldn't dinosaurs have occupied some of the ecological niches apes needed to evolve, potentially preventing apes from emerging while dinosaurs were dominant? So... no King Kong? (See the previous chapter.)

Well, not necessarily. "Dinosaurs may have helped prevent the evolutionary circumstances that eventually produced apes" is plausible. "Apes cannot evolve while dinosaurs exist" is a much stronger claim, and that hasn't been established.

Still, it would be incredible to know the actual origins of humanity.

I bet the real story goes deep!

Do You Truly Believe in Jesus Christ?

Do you truly believe in Jesus Christ?

Ask the kid me. No.

Ask the teenager me. No.

Ask me now. **Yes.**

What changed?

I am still an atheist. But what changed is that I now have more information about reality. I have always thought that Jesus Christ was like a meme—as Richard Dawkins says—a mind virus. So, I didn't believe in Jesus because I didn't like the idea of having this “virus” infecting and controlling my mind, which is understandable.

But then three things changed.

First was Manly Palmer Hall. He made me realize that there may have been a super-advanced civilization in the past. How advanced? Well, let's just say they fly around in what we would call UFOs. So now I could understand things like the Shroud of Turin, and consider the possibility that Jesus was a member of these advanced humans—that he actually accomplished the Great Work in alchemy and became a being of light.

The Shroud of Turin could then be seen as physical proof of ascension—of someone completing the Great Work and becoming a living Philosopher's Stone.

So now Jesus was no longer a meme in my mind, but an actual person who had ascended.

But then you might say that ascension doesn't make you into God. So Jesus is not God, but still a man.

Okay—first of all, we cannot know that, because we have no real notion of what ascension even means. For all we know, when you ascend, you become one with God. So Jesus might actually have been who he said he was.

Okay, then the second thing that changed: I went from being a materialist to becoming an idealist. To be fair, I was never really a materialist—I just didn't have the philosophical know-how to understand what I actually believed, so I adopted the mainstream view. That's a bit embarrassing, because I now see that view as deeply flawed

and full of paradoxes. Bernardo Kastrup does a really good job of dismantling materialism.

Long story short, now I'm an idealist. And here, God is real, because God is simply universal consciousness. However, if you want to call God Buddha, I'm fine with that too. Again, I'm still an atheist in the sense that I'm not religious, and I don't believe in the supernatural.

And the third thing that changed—and this is a BIG ONE—Randal Carlson convinced me that the Great Flood actually happened. **And that totally changed everything I thought I knew.** I mean, the atheist in me couldn't recover from that!

Thus, when you put it all together—yeah, **Jesus could be who he said he was.**

And that is far out, man!

Do you believe in Jesus Christ?

Yes.

Do you accept Jesus Christ as your lord and savior?

Yes. No. Maybe.

So... see you in church next Sunday?

NO!

—Let's not get carried away.

That said, I do accept Jesus into my heart now because I understand the alchemical implications of who he is. He is like **Neo in The Matrix**.

And I mean, who better to have on your side than an ascended master? More: accepting Jesus into your heart fills you with love—you finally sync with deeper reality.

Richard Dawkins: *Textbook case. The happier the host, the better the spread!*

What psychonauts report is that the universe is basically made of tori (or toruses), and that the torus has the unique ability to function as an individual unit—remaining completely closed—or to open up to other tori. I believe this is what free will is.

So you can open up to Jesus, who is basically an advanced torus-complex, and become part of it—which I believe is how it works on a metaphysical level.

Just beware that you don't open yourself up to demons and become part of a bad complex. Essentially, you need to invite something in—nothing can enter your torus unless you open it from the inside.

Basically, a torus is a self-contained unit, so it cannot be opened from the outside. (The torus can be seen as your halo or aura. Chakras are also toruses; at the fundamental level, everything is a torus/feed-back loop.)

You could argue that you don't want to open up to Jesus in case he is a demon in disguise who came to fool humanity, so it might seem safer to stay on your own path. But I think Jesus is a pretty safe bet—I don't think he was a demon. Except all the snake symbols everywhere, I think he is perfectly fine. OK, maybe close your torus!

Christian: Jesus is life—greater than anything else in creation!

Atheist: That's what brainwashing looks like.

Me: Maybe—but I'm not religious, and I can still see the point. If you take Jesus Christ out of religion and view him as a philosopher, you're left with a model of compassion, courage, and integrity that's hard to beat. At some point, you have to ask: What if he is who he said he was?

Think of it as a metal plane crashing in the jungle, and all the jungle people start worshipping the plane and building replicas out of straw. Then you say they are just a cargo cult, and that the straw planes are just that—straw, not reality. What I'm saying, however, is this: what if not all the planes are made of straw?

It's actually quite simple: many animals living today have ancient lineages, so why would humanity be only 300,000 years old? Humanity could be far older, and we may have reached a level of technology in the past that hasn't been matched today—not even close. These humans might have discovered that idealism (God) is true, and even how to align with it (ascension). That could be reality—that's all I'm

suggesting. And the evidence is there for anyone to see, so it's not a lack of evidence.

Consider the Shroud of Turin, the Great Pyramid, Angkor Wat, terra preta, ayahuasca, ancient maps (e.g., the Piri Reis Map), the Baalbek stones, Sacsayhuamán, as well as sacred geometry and alchemy—alongside sites like Göbekli Tepe, Puma Punku, and artifacts such as the Antikythera Mechanism.

At some point, the pattern becomes too consistent to ignore. This isn't a handful of anomalies—it's a global footprint. Different cultures, different continents, same underlying signals: advanced knowledge, precision engineering, and a deep understanding of geometry and consciousness.

You can dismiss each piece on its own. But taken together, they start pointing in one direction: we are not the first civilization to reach a high level of development.

Then you go to the Forbidden City in China, and the foo dogs are guarding the same secret under their paws!

And if you still disbelieve after that visit, **then you're willfully blind.**

Part B)

Okay, I believe I know real reality, which most people don't, because they are stuck believing in the dogmatic belief systems they grew up with, whether atheistic or religious. Real reality is beyond both.

Note: I'm just a free thinker trying to logically assemble the puzzle pieces we call reality. Here is what I have gathered so far:

Idealism wins over materialism because materialism is paradoxical (e.g., the hard problem of consciousness). Thus, it all began with the cosmic mind. God is real. The universe is a kind of dream that, over time, became more material. Thus, mind over matter, meaning "magic" was real, at least in the past when mind had more control over matter that hadn't become so physical yet. But it still applies today. The real **Secret**: Mind over matter is still valid.

The Big Bang is not the beginning but points to the center of the cosmic dual torus, and the dual torus is what the cosmic mind (God) looks like from the outside. Thus, the universe is eternal. It didn't begin and it cannot end. It simply recycles matter. It is the ouroboros. And this recycled matter is the prima materia, the Philosopher's Stone. Because nature is fractal, you can get recycled matter on a smaller scale too. And this is the fuel in UFOs. UFOs are not alien craft but from an advanced human race that lives in the Hollow Earth today.

The Earth is hollow because it is a white hole. If black holes exist, then so must white holes. That is, the dual torus that is eternity itself has an expansion (white) and contraction (black) phase. Thus, the Earth grows over time; there was no Pangea. Modern science is wrong. And because the Earth grows, it was smaller in the past, which allowed humans to become giants. Giants were real. That is, humanity is mil-

lions and millions of years old, not just 300,000. And this explains the giant size of dinosaurs and why we have bad backs today. That is, we were meant for another world, a lighter world.

Humanity itself comes from the Hollow Earth, not Africa, and Atlantis was modeled after the great city in the Hollow Earth itself.

Dragons were real and flew in the Hollow Earth. King Kong (giant apes) was real. And wizards were real and had elongated skulls. And Zeus was real, and he was really tall. I bet the statue of him was his real size.

And the Leviathan was real. That is, sea monsters were real; basically, everything was bigger in the past.

Moving on: Wizards could lift giant rocks with “magic staffs” powered by crystals that housed the power of the Philosopher’s Stone, and that is how the Great Pyramids were made. The Great Pyramid was a dual-purpose machine: part alchemical lab to produce more prima materia and other chemicals, part power plant, and part spiritual machine.

During the Ice Age, we had free energy technology. There were Tesla towers all around, and we flew around in airships, and society was very modern-looking. Think Final Fantasy 9. And “giants” were still around; you can see it in the architecture that survived. The star forts were from this time, and many modern buildings as well. I think the whole Final Fantasy series contains truths about our past. Final Fantasy 7 is basically the tale of Atlantis and how corrupt it was.

Now the dark truth: the Moon, the Death Star, was brought here, and it houses a free energy weapon that can destroy planets! Planets have been destroyed in our solar system already, which we can clearly see. *Star Wars* is real. There is a war between humanity and interdimensional aliens, Reptilians, the Sith. And again, magic, the Force in *Star Wars*, is absolutely real.

And now AI is on the rise. I think this technology has been seeded to us through black projects. What it means, I am not sure yet.

The Reptilians cannot physically come here because they are in another dimension, but they can be summoned through Satanic rituals, hence all the darkness going on in our world today. But what if they could hack our robots and take control of them? Is that their endgame?

And Jesus, Skywalker, I believe, was an advanced human being from this master race in the Hollow Earth we talked about earlier, and he did ascend. He completed the Great Work and became a light being. I think the Shroud of Turin is ultimate proof of ascension.

And how do I know all of this? When I was little, I played *The Legend of Zelda: A Link to the Past*. And I got the pun, a link to the past. Someone knows. Freemasons put the truth in movies and video games. We think it is fiction when, in reality, it is reality. Which is why I would bet a lot of money that Bigfoot is real, and you can see him in *Star Wars*, wink wink. Yeah, he is tied to the UFO mystery, Millennium Falcon, and why he is so elusive. But it was more than that. It is like I remember this stuff. I have lived it before. I believe I am reincarnated. There, I said it.

That said, I don't think I'm spot on with everything in this text. The Moon could have been brought here to save lives, for example. The Earth-Moon system seems too perfect to be random. But who knows how deep the rabbit hole goes?

More: I am still unsure whether we evolved from giant apes in the Hollow Earth, or whether the old legends are correct and humanity is as old as time itself, with Earth at the center of creation. Earth = Heart. How? Donald Hoffman has argued that spacetime is an interface of the animal mind, and it would make sense, then, that Earth is the center point of this interface. And if idealism is true, the old tales of humans starting out as thought-forms over 30 meters tall begin to make sense.

Then the dream we call the universe becomes more and more physical, and Earth grows larger and larger, while humanity becomes smaller and more physical. So imagine humanity becoming so advanced in a previous universe that we created a new universe containing our form from the very beginning. Ra, emerging from the cosmic egg at the dawn of creation. I mean, if idealism is true, then materialism and evolution, as traditionally understood, are simply false. Something else is going on.

But I also said the universe is eternal, so it may seem like I am contradicting myself, but not really, because there is a difference between our interface and eternity itself. It is like the cosmic movie projector is eternal, while the films it casts can change.

Still, I have not figured out the true story of humanity yet, but I bet it is big!

And Stargates were real, powered by free energy, aka the Philosopher's Stone. Basically, our past is closer to a mix of Star Wars, Final Fantasy, and Zelda. So, again, the occupants of UFOs are not alien, but human.

Imagine if all of this truth comes out. We could live for thousands of years like this master race in the Hollow Earth, never grow old, never become sick, researching ascension! I mean, this is so awesome, but on the other hand, we have this interdimensional war, and they don't want people to know about it. A war that has been going on for who knows how long.

Or maybe the dark truth is this: the war is over, the Sith won, they placed the Moon in orbit ready to destroy this world in seconds, and they keep us around for whatever reason.

If idealism is true, then the idea of the Earth being a prison planet and a soul trap could ring true too, that this is the demiurge's domain. Or is the war still going on, and no side has won?

Full Disclaimer: I'm not saying all the details in my belief system are true. They could be, but that's not the point. The point is that I believe my belief system is closer to reality than that of modern science.

Try this line of reasoning and see if it fits: Say you tried to solve the hard problem of consciousness for a billion years and couldn't do it. You might then conclude that idealism could be true after all, and you

look up a video on YouTube with Bernardo Kastrup, and it finally clicks. Some sort of cosmic mind must be real, call it God, Buddha, or whatever. Now you have a starting point.

For the next part of the reasoning chain, you look out at the universe. Black holes exist, but if there is a cosmic mind and minds are symmetrical, then white holes should also exist. More: You can't just insert a fully formed 3D reality into existence. It needs to come from a point of origin; otherwise, you have infinite regress. Hence, the expansion side (white) must be real.

That is to say, if you carve the universe up into a grid and place nodes on that grid, then ask why this node over here is here and not eternally over there. But if you have expansion and contraction, you have a point of origin and thus no paradox, which a fully inserted 3D world would have.

A fully given 3D grid already assumes space, position, and relations. So it doesn't explain those things, it just presupposes them. That creates a grounding problem. A point of origin with expansion (white hole) gives a generative story for how those relations arise.

Then jump a hundred years into the future, when science has finally caught up with the idea that planets are white holes. At that point, the rest of my story starts to look logical.

But then you say, "Science has proved the Earth cannot be hollow." To that I say: study the philosophy of science for a full year, and **you'll understand how questionable that claim is**. Some version of the hollow Earth could be true if planets are white holes.

Then you say gravity would crush a hollow Earth. My reply: no, that is another logical mistake. You are assuming a static Earth, but the Earth is not static. It is growing, and **that changes everything.**

Coda

If entire planets undergo growth, then their gravitational conditions would also change. In such a lower-gravity environment, significantly larger life forms, including what we might describe as giants, become more physically plausible.

Yes, in principle.

Lower gravity would make larger organisms more physically plausible, so “giant-like” life becomes easier to imagine in that kind of environment.

So when you hear tales of giants living on Mars millions of years ago, it could actually be real.

And when you hear tales of a great flood and that Noah lived to be 950 years old, yeah, it could all be real.

The Bible has a funny way of turning out to be correct in the end, perhaps because it was partially written by the “gods” of our ancestors, the highly advanced human beings among us. Master Mason Manly Palmer Hall also believed that these immortals lived among us. To me, it makes sense, because where else would all the extraordinary stories in the Bible come from?

Also: In the newer Star Wars, they introduce the idea of a “dyad in the Force.” And I was like, **I told you**, because the real force in the universe is the **dual torus**. Somebody knows the real truth, and they are sharing information. When you go to see a Star Wars movie, you go to get entertained; *I go to learn*.

Skeptic: “You’re so wrong. It’s about a galaxy far, far away.”

Me: “And what do you think our galaxy is?”

Skeptic: “It’s...”

Skeptic: “...oh.”

More Rabbit Holes

For a deep dive into the rabbit hole, check out *David Icke* and *Bergy the Iceman*. However, when I search online, I can't seem to find Bergy's work anymore. If Icke is Yang, then the Iceman is Yin. I think they complement one another.

A black race in Egypt? This is another deep rabbit hole.

Golems. This topic can take you incredibly far down the rabbit hole if you truly investigate it.

Dragons across civilizations that never contacted one another. Jump right in.

Another rabbit hole: the Stonehenge altar stone. Neolithic people deliberately moved it ~hundreds of km—really? That seems too far, too unbelievable. So now some say ice sheets moved it during the last Ice Age. Mainstream science trying too hard here! I mean, the idea is

“too convenient.” It’s what mainstream scientists default to because they overreach.

- Human transport → “too hard to believe”
- Glacial transport → “too mainstream”
- Therefore → **rabbit hole**

(Martian Manhunter = the reptilian agenda?)

Is It Really Just a Coincidence?

Dragons loving gold and alchemists/wizards making gold—I mean, is it really just a coincidence?

And it is all so simple, really. All animals living today are ancient, so why would humans only be 300,000 years old? We are not. We are millions and millions of years old, and we rose to a level of technology in the past that is insane. We figured out that idealism (all is mental), not materialism (all is matter), is true, and that existence itself is all about balance. When we align with that balance, we can ascend like Jesus did.

And now we know who he was. He was just a man with the knowledge of the ancients. Maybe because he was one of them! Who do you think flies around in the UFOs? Yes, we are talking about that level of technology. And the Freemasons know, and they tell us through

movies. *Star Wars* is basically a documentary of the past. That galaxy far away is our galaxy.

Hollywood knows.

So they are not lying. Our galaxy is a galaxy far away, but that is also how they manipulate us psychologically.

And this also solves the mystery of Bigfoot. Basically Chewbacca. Bigfoot is another species of hominin that evolved with us and is now helping our ancestors, which is why he is so elusive.

Yes, I'm saying the Millennium Falcon is a hint that UFOs are man-made, not alien, and that a living ancestral lineage operates them.

I just want to put it out there so that when the truth comes out, I can have the pleasure of saying: **told you so.**

The age of magic will begin again. Magic is real, and that is the really cool thing. What is magic? Magic is the fact of the mental universe, **mind over matter**. Basically, the universe started out as a cosmic dream (in the One Mind) that became more physical over time. That is why it was easier to do magic in the past, but it can still be done. We just need to relearn the old ways.

Yes, the *Force* in *Star Wars* is real. *Star Wars* is real, and they have weapons that can destroy entire planets! You can tell planets have been destroyed in our solar system already. That is the terrifying part.

The good part is that Jesus was real, and he really did ascend, and the Shroud of Turin is proof.

Imagine how different an age of magic would be.

The dawn of Aquarius is upon us, and the magical age will rise again!

Cosmic Coincidence

The Sun's diameter is ~400 times the Moon's diameter.

The Sun is ~400 times farther from Earth than the Moon is.

Those two ratios almost cancel. Consequently, the Sun and Moon have almost the same angular size in our sky—roughly half a degree. That's why the tiny Moon can cover the enormous Sun almost perfectly during a total solar eclipse. NASA describes this as a “cosmic coincidence”—essentially, a chance occurrence.

But I don't believe this is a coincidence. I think the Moon was brought here. When you consider the larger picture presented in this book—the Great Pyramid, UFOs, and everything else I've discussed—the possibility that someone in the distant past possessed the technology to do this makes far more sense to me than simply calling it a coincidence.

Skeptic: Earth isn't logically the only world where such an eclipse could happen. NASA notes that a planet with a moon having the appropriate size-and-distance relationship to its star could experience similar total eclipses.

Me: Okay, how many planets have they actually found with moons like that in our universe?

Skeptic: Astronomers have confirmed more than 6,000 exoplanets, but zero confirmed exomoons. So the number of known extrasolar planets where we've actually established a Moon/Sun-like apparent-size match capable of producing an Earth-style total solar eclipse is... zero. But NASA's statement is about physical possibility, not an observed example: if another planet has a moon of the appropriate size and distance relative to its star, it could experience total eclipses like ours.

Me: How fucking stupid do you think I am? No, the Moon was brought here. And don't throw the anthropic principle in my face, or I'll scream! Do any of the other planets in our own Solar System have this kind of relationship?

Skeptic: Not quite. Earth occupies a unique position in the Solar System because of the nearly equal apparent diameters of our Moon and Sun.

Me: Yeah, no shit!

Skeptic: You really don't believe in coincidences, do you?

Me: No, I don't—not when something obviously isn't a coincidence. At that point, the word coincidence stops explaining anything and starts explaining the problem away. Hell, apparently coincidence wasn't even enough for this one—you had to upgrade it to a **“cosmic coincidence.”** Yeah, not a chance.

The Logos

The Logos is balance, dynamic equilibrium, as we have seen; so the best path in life is to align with it.

Why So Many Pictures?

When I was a child in school and began a new project, I always preferred to start with facts. If I were writing about something like the gods of Olympus, I would first focus on presenting the information clearly, carefully shaping the letters, almost as if I were drawing them. After that, I would add pictures, symbols, and small illustrations, gradually turning the page into something more than a simple assignment. It became a composed piece, where knowledge and presentation existed together.

In retrospect, this approach was not unusual. Many children instinctively begin with facts because they provide structure and orientation when approaching a large or imaginative subject. The addition of drawings, symbols, and visual elements is not merely decorative; it is a natural extension of understanding. For a child, learning is rarely confined to text alone. It is visual, tactile, and expressive.

If I were to rediscover one of those old projects today, the work itself might not fully convey the memory I now have of it. In memory, it

felt grand and almost epic; in reality, it was likely simple, sincere, and shaped more by imagination than mastery.

Nevertheless, in that same spirit, I wanted each chapter to be accompanied by an image, to evoke something of the tactile, expressive feeling I experienced as a child.

(However, as you can see, there are no pictures in this book. Maybe I'll add them in a future edition. I have all the pictures, but I ended up not using them this time around.)

Epilogue

Perhaps I am wrong.

Perhaps the universe truly is nothing more than dead matter drifting through meaningless space. Perhaps consciousness is only chemistry, love only biology, and meaning only a temporary hallucination produced by survival instincts inside apes standing on a rock orbiting an ordinary star.

Perhaps Atlantis never existed.

Perhaps the flood myths are only stories.

Perhaps the ancients were primitive.

Perhaps all mystery will eventually collapse into equations.

Perhaps.

But only perhaps...

This book was never meant to provide final answers. In many ways, it is an invitation — an invitation to look again at the world you were taught to take for granted.

To question.

To wonder.

To notice the cracks.

Because once you truly begin looking, reality starts becoming **very strange indeed.**

You begin noticing how modern civilization explains “everything” yet somehow understands less and less about itself. You begin noticing how disconnected humanity has become from myth, symbolism, ritual, mystery, and meaning. You begin noticing that beneath our technological sophistication there exists an almost unbearable spiritual hunger.

And perhaps that hunger exists for a reason.

Perhaps the ancient world was not entirely naive.

Perhaps modernity is not entirely enlightened.

Perhaps both contain fragments of truth.

Or perhaps reality is something far stranger than either side currently imagines.

I do not know.

But I do know this:

The world feels increasingly unstable.

Civilizations rise and collapse.

Paradigms shift.

Certainties dissolve.

And humanity once again stands before the unknown.

We are entering strange territory.

Artificial intelligence grows rapidly.

Faith in institutions declines.

Reality itself becomes contested.

People no longer agree on what is true, what is real, or even what it means to be human.

And beneath all of it, I sense the return of something **ancient!**

In the end, I believe the deepest danger facing humanity is not ignorance, but spiritual paralysis — the loss of curiosity, wonder, courage, and the willingness to ask forbidden questions.

Because civilizations do not die only from floods, fire, or war.

Sometimes they die because they stop searching.

So wherever this strange path leads, I leave you with only this:

Protect your curiosity.

Protect your capacity for wonder.

Protect your ability to think beyond the walls of your era.

And above all, remember that reality may be far stranger, more beautiful, and more alive than modern civilization dares to imagine.

The crack is already there.

The question is whether humanity still has the courage to look through it.

— Thor Fabian Pettersen

About the author

My name is *Thor Fabian Pettersen*, and I am a writer from Norway with a love for poetry, graphic design, modern art, music, technology, and **coffee** with *milk*. I enjoy creative projects that mix words, images, and ideas, and I have spent time experimenting with EDM and piano music as another way of expressing the things that interest me.

From an early age I have also been fascinated by philosophy, the occult, and the deeper mysteries of existence. Over time this curiosity led me to develop my own philosophical system about reality and consciousness. I am a member of several high-IQ societies (Torr Society, THIS High IQ Society, Romanian High IQ Society (ROHIQS), Canadian High IQ Society, Philosophy High IQ Society, World Genius Directory) and enjoy exploring big ideas, though I balance that with simpler pleasures like playing online chess, even if I am not very good at it.

Art has always been a strong inspiration in my life. I love graphic design and modern art, and for reasons I cannot fully explain, I could

stare at Andy Warhol's *Campbell's Soup Cans* forever. I often feel like I can almost taste and smell art. That may be why I am drawn to modern art. It feels colorful, bold, and alive.

A painting might feel **textured**, taste *metallic*, or smell **warm** or *smoky*!

And here's the thing: I feel this way when I read poetry too, which is why I like it so much. However, graphic design fills my senses with stronger impressions (I think).

I also loved LEGO as a child, and I still do. Maybe I'll get back into it in the future. But back to what is perhaps my greatest passion: music.

I love making music on my computer, and I'm a huge gear slut—even though I have no gear! But you can get digital replicas (plugins) of all the iconic gear in history, so I've bought so many plugins, and I love it. Still, it's mostly a waste of money because I never use them, and the real hardware, in my mind, is the real thing—the real weight and the real life. So now I just buy mixing services that use analog gear.

And when I am not writing or making music, I enjoy science fiction shows like *Stargate Atlantis*, where I always root for Rodney McKay. I also hope that if the show ever returns, they bring back John Sheppard, because Joe Flanigan clearly loved the role. I also enjoy gaming, and lately Fortnite has become my favorite game.

My favorite philosopher is Terence McKenna, and I have always had a fascination with wizards, strange ideas, and the possibility that the universe might be far more mysterious than it first appears.

Add deadmau5 and Infected Mushroom to the mix, and you have probably cracked the riddle that is me.

But I have to say this: the most extraordinary song I have ever heard is *Amber Sun* by Gareth Emery and Ashley Wallbridge. I am also a great admirer of Bjorn Akesson and a longtime fan of his music. Well, that was a small glimpse into who I am.

And don't forget hardstyle! Hell yeah!

And when it comes to piano music, there is too much good stuff out there to mention, but check out Brian Crain.

On IQ:

My best score is 154 (SD15), but my ego says I can break 160 on high-range tests! Who knows if my ego is right?

I'm not trying to brag. (*Ego: Yes, you are.*) I just know that when you don't have a formal education, it can sometimes be hard to get people to take you seriously. I figured showing my IQ scores might help demonstrate that I have something to offer. Part of the reason I got into the IQ world was to boost my credibility.

Okay, to be completely honest, I've been obsessed with IQ ever since I was a teenager—and I still kind of am. There's a reason I rooted for Dr. Rodney McKay.

When I was a teenager, I used to read *William James Sidis (The Animate and the Inanimate)* because he was supposedly the smartest man who ever lived. His command of the English language was a joy to read.

This is actually where my idea of free energy began. So, all in all, it's been a long journey.

Skeptic: “If you want people to take you seriously, maybe don't shit on modern science while simultaneously talking about giants, the Hollow Earth, and Atlanteans flying around in UFOs building pyramids.”

My reply: Point taken. I guess my work is for people with real brains—the ones who are sick to death of the intellectual bullying that passes for academic sophistication these days. If an idea is wrong, destroy it with reason. Tear the argument apart. But if all you have is ridicule, then you're probably not reading this book anyway. You're too busy mistaking conformity for intelligence and consensus for thought.

Night Owl

- **Star sign:** Aquarius
- **Favorite games:** Fortnite, Final Fantasy VII (+ 8 + 9 + 10), most Mario games, The Legend of Zelda (*A Link to the Past*)

+ *Ocarina of Time*), The Elder Scrolls IV: Oblivion, Devil May Cry (1 + 3)

- **Favorite food:** Pizza, tacos, Norwegian meatballs in brown gravy, hamburgers, lasagna
- **Favorite drinks:** Coffee, cola, beer
- **Favorite movies:** Gladiator, The Hitchhiker's Guide to the Galaxy, The Matrix (all of them), Guardians of the Galaxy (all of them), + so many good movies
- **Favorite TV shows:** Firefly, Stargate Atlantis, Battlestar Galactica, Futurama
- **Personality traits:** Introverted night owl
- **DAW:** FL Studio
- **Favorite plugins:** All of them
- **Hardware dream list:** Yes!

And if I were to make this list tomorrow, I would probably add a great deal more—more foods, drinks, films, and broader themes such as favorite writers, composers, and so on. But I'll leave it here, otherwise it would start to drag on. And I probably forgot something important too!

Oh, I forgot: *Star Wars* (I fully believe this could be *real*).
